## **DEDICATION**

This work is dedicated to the immortal, invisible, the only wise God, creator of all that exist and possessor of the heavens and earth; whose love is everlasting, to my Lord and Saviour Jesus Christ; the author and finisher of my faith and the blessed Holy Spirit; my companion and the ever present one.

## ACKNOWLEDGEMENT

I give thanks to God the giver of all good things, for bestowing me with everything necessary to accomplish this feat.

My gratitude goes to my supervisor, the immediate past Head of Department; Social and Environmental Forestry, University of Ibadan, Professor B.O. Agbeja for his unwavering commitment, foresight, constructive criticism, professionalism, guidance, selflessness and goodwill which has culminated to the eventual completion of this task. I am most grateful to Prof. O.I Ajewole; the Head of Department, Social and Environmental Forestry, for his interest and contribution in my work. My unreserved appreciation goes to Dr. A.A. Alo for his sagacity as the Postgraduate Coordinator of the Department and also for his guidance in the GIS aspect of the work. I do most sincerely appreciate and acknowledge the invaluable contributions on my abstract by the Department's Postgraduate Committee; Prof. O. I. Ajewole, Prof. S.O. Jimoh, Dr. I.O. Azeez and Dr. A.A. Alo and also, Prof. E. K. Ajani (the Faculty's Dean), Dr. (Mrs.) A. O. Akinyele (the Faculty's Sub Dean), Prof. Adetula Jenyo-Oni (H.O.D AFM), Dr. Siyanbola Omitoyin (AFM PG Coordinator), Prof. Lameed (H.O.D WEM) and Dr. Funmilola Ajani (PG Coordinator WEM) My appreciation also goes to the former ED FRIN; Prof. S. O. Badejo and the DG FRIN; Prof. A.A. Adepoju for the permission to undergo this programme. I thank, Dr. O. O Famuyide, Dr. O. Adebayo, Mr. Abu and Prof. F. Idumah for their fatherly roles and creating conducive work environment in the Department of Forest Economics and Extension, Forestry Research Institute of Nigeria. Mr. A. O. Onafeli, Dr. O. F. Falade and Dr. F. N. Ogana deserve my appreciation. My thanks also goes to Dr. J. Akoun, Dr (Mrs.) J. Amadi, Dr (Mrs.) Ogunwande, Mr. Olowoyo, Mrs. A. O. Adeniran, Dr. O. O. Obadimu, Mr. F. Odediran, Dr. A.A. Adejumo, Mr. A.A. Adeyemo, Mrs. O. Ekuri, Mr. C. Agbor and Dr (Mrs.) E. B. Onyenue all in FRIN, for their encouragement and unique contributions.

My sincere appreciation goes to the staff in all the State Departments of Forestry in Ekiti, Lagos, Ogun, Ondo, Osun and Oyo for their cooperation in supplying some of the data used for the study as well as other forestry stakeholders in the afore mentioned states.

Many thanks to Apostle S.A Popoola and Rev'd Mrs. Omowumi Popoola for their spiritual oversight and mentoring over the years. My gratitude goes to Pastor Olubunmi Anjorin for his inimitable efforts and prayers, Pastor (Mrs.) Catherine Ebunu, Pastor Emeka Igbokwe, Pastor Seun Raji, Brother Segun Ibrahim and all WOCOM Prayerband members for their prayers and encouragement.

My late Dad, Mr. Peter Olise Owese, a man helped by God and blessed with the qualities an ideal father should have. You did your very best to ensure I am what and who I should be. Thank you Dad; your legacy lives on. I believe, having finished your race, you have been given a prominent position and decorated by the Almighty Himself. To my sweet Mum; whose unwavering support, love, tender care, guidance, prayers and encouragement has been a major motivation, to you I say, thanks a million. You shall yet eat the fruit of your labour in Jesus' name, Amen. To my elder sister and her husband; Mr. and Mrs. Odafe and my younger ones; Tony (who was called home nine days before my final defense, you have gone but your good deeds and your memories lives on), Blessing, Collins, Faith and Harrison and their spouses, I thank you for your encouragement and support. You were carefully selected; you are the best siblings anyone can ever pray to have. Thanks a lot! May the bond that binds us together be yet stronger and may we fulfill purpose and finish our course; strong, joyfully and with divine commendation in Jesus' name, Amen.

Many thanks to my love; Olunike Sharon Owese, for her great sacrifices, understanding, perseverance, unparalleled support, prayers, holding forth the home front during my field work and creating the tranquility which is a great asset in achieving anything of worth. My appreciation goes to my lovely boys and beautiful girl; Ephraim, for his effort, combined with a rare display of intelligence during coding and analysis especially at odd times and his prayers, to Samuel, for his prayers and urging me to finish up the work so we can resume our play and Royalty, the baby of the house, the icing on our cake, your arrival brought so much joy, excitement and pleasantness. We shall indeed see the travail of our souls and be satisfied in Jesus' name, Amen.

To friends, colleagues, well-wishers and all those who are part of my success story, whose names are too numerous to mention, may you be abundantly rewarded in Jesus' name. Amen.

## **CERTIFICATION**

I certify that this research work was carried out by Theophilus OWESE in the Department of Social and Environmental Forestry, University of Ibadan, Nigeria.

Dip. in Urban Management Tools for Climate Change (Rotterdam)

Forest Policy, Law and Administration

Department of Social and Environmental Forestry

University of Ibadan, Nigeria.

## ABSTRACT

Forest Governance (FG) is the process of making and implementing decisions on forests. This comprises policy, legal and administrative frameworks that determine how forests are managed. Its quality is central to the enhancement of forest benefits. In Nigeria, poor FG has been linked with forest loss and degradation with dire consequences. However, information is limited in tackling this problem in southwestern Nigeria. Therefore, the elements of forest governance were investigated in Southwestern Nigeria.

Two forest reserves were purposively selected in each of the six states with the exception of Lagos where the only one (Ogun River Forest Reserve (ORFR)) under some form of management was sampled. The other selected forest reserves were: Ogbese and Ikere (Ekiti); Aworo and Olokemeji (Ogun); Oluwa and Akure (Ondo); Shasha and Ago-Owu (Osun); Gambari and Osho (Oyo). Landsat satellite imagery was used to determine the extent of forest cover, changes in cover and rate of deforestation in the selected forest reserves from 1987 to 2017, using supervised classification method. An established sampling proportionate to size was used to select timber contractors (n=82), saw millers (n=152), plank dealers (n=110), forest community dwellers (n=149) and forest plantation owners (n=40). All the forestry staff in Lagos State due to their limited number and fifty percent of forestry staff (n=175) in other states were sampled for questionnaire administration. Data obtained on staffing, policy, management plan, forest law enforcement, planning, decision-making processes, factors negating good forest governance and stakeholders' willingness to own forest plantation were analyzed using descriptive statistics, chi-square and logistic regression at  $\alpha_{0.05}$ .

Forest cover was highest in Oluwa (686.7km<sup>2</sup>) and least in ORFR (5.2km<sup>2</sup>) in 2017. Percentage change in forest cover was highest in Ogbese (16.8%) and least in Ago-Owu (-89.1%). Annual rate of deforestation was highest in Akure (2.3%) and least in Ikere (0.2%) between 1987 and 2017. Four forest reserves (ORFR, Oluwa, Akure and Shasha) had no technical staff while Ikere forest reserve recorded the least deficit in technical staff (66.7%). The highest deficit in professional staff was recorded in Shasha (96.0%) while no deficit was recorded in Ikere and ORFR. Stakeholder's knowledge on forestry issues had no significant relationship with involvement in forest policy formulation ( $\chi^2=1.2$ ). Management plans were perceived to be obsolete in all the states except in Ekiti State (18.9%). Existence of forest law had no significant relationship with crime prevention ( $\chi^2=1.4$ ) and detection ( $\chi^2=0.1$ ). Perception on existence of checks and balances was highest in Ekiti (54.5%) and least in Osun State (18.2%). There was significant relationship between forest policy institutional framework support and planning ( $\chi^2=11.68$ ) but not with decision-making processes ( $\chi^2=3.5$ ). The forestry sector lacked transparency (Odd ratio (OR) =94.5) and participation (OR=79.3) which negatively influenced good forest governance. Provision of seedlings (OR=12.9) and capacity building (OR=2.3) influenced stakeholders' willingness to own forest plantation.

Checks and balances in extant state forest policies were weak and forest management plans were obsolete in Southwestern Nigeria. These could negatively affect the effectiveness of forest governance.

## **CHAPTER ONE**

### **INTRODUCTION**

#### **1.0 Background**

Competing demands for food, fuel and profit are driving the loss and degradation of the world's remaining forests. Governments, the private sector and citizens in many countries are struggling to manage the conflicts among these priorities while also protecting long term public interests. For example, the large scale conversion of forests to timber and agriculture can generate short term income for governments, the private sector and communities. But if unchecked, these trends are leading to a loss of national wealth, natural habitats and livelihoods - particularly for forest dependent communities and indigenous people. Many of these challenges stem from underline weaknesses in the way the forest resources are governed (Mohanty and Sahu, 2012). Conflicts in forestry amongst stakeholders seem to be resolvable through a governance system which accommodates the interest of these stakeholders and with the ethos gendered towards good forest governance. This is when the ideals of sustainable forest management could be realised.

FAO (2010) stated that “forest governance is influenced by a range of factors, such as decentralisation, trade liberalisation globalisation, changing demand for forest products and services. The climate change mitigating effects underscore the global attention accorded forestry, aside its immense contribution as provider of essential goods and services and therefore heightened the need for a governance system that is collaborative in nature.

Weak governance or poor governance; which is the absence of the fundamental principles of good governance in the forest sector has been linked with illegal logging and uncontrolled

deforestation both locally and internationally. These concerns have led many countries to rethink the role of government in managing their forest resources and actively step away from centralised decision-making processes and direct government implementation of forest programs (Gregersen *et al.*, 2004). Governance is an essential part of sustainable forest management (ODI, 2006). "The quality of forest governance in the forest sector has begun to attract greater attention, including its recognition as a central aspect of sustainable forest management, according to the World Bank (2004)." There is general consensus that improving forest governance would be necessary in order to handle competitive forest demand. The forestry administration has been monopolised within the federal system in Nigeria by the state government for the last forty years. The exclusion, directly or indirectly, of stakeholders such as (local community dwellers, hunters, fishermen, timber contractors and other non-timber resource users) from forest management has led to weak forest governance and consequent forest reserve crises in Nigeria (Akinola, 2007)

Larson and Petcover (2011) opined that the transition from state control and hard law to deregulation and soft law in the early 1980s was the most dramatic change in forest governance over the last few decades. This has been called the transition from government to governance, which has had a large effect on forest governance, both globally and nationally. The concept of governance, and particularly good governance, has become an important factor in the discourse on international development.

An aspect related to policies, legal and institutional structures and forest governance was included in several regional processes in the mid-1990s in their monitoring and reporting frameworks (Marjo *et al.*, 2012). This portion was later recognised by the UN General Assembly in 2007 as a thematic element of sustainable forest management (UN, 2008) and was taken up in the United Nations Global Forest Resources Assessment (FAO, 2011).

Weiland and Deduerwaerdere (2010) defined forest governance as “the process of making and implementing decisions on forest. This comprises policy, legal and administrative frameworks that determine how forests are managed. It generally refers to the quality of decision-making

processes, their transparency, accountability and equity, rather than the formal political structures of government.

In forestry, sustainable forest management is a state of idealism, where

According to FAO (2018), “forest governance is the way in which public and private actors, including formal and informal institutions, smallholder and indigenous organisations, small, medium-sized and large enterprises, civil-society organisations and other stakeholders negotiate, make and enforce binding decisions about the management, use and conservation of forest resources”.

The aim of monitoring the extent and characteristics of forest resources is to understand and reduce unplanned deforestation, restore and rehabilitate degraded forest landscapes, evaluate the important function of carbon sequestration by forests, other wooded lands and trees outside forests, and designate forests for different purposes. The extent of forest resources is the first parameter in measuring sustainable forest management. Information on the extent of forest resources has formed the backbone of all global forest resources assessments and continued to be a major topic in forest resources assessment. Forest area is an easily understood baseline variable, which provides a first indication of the relative importance of forests in a country or region. Estimates of change in forest area over time provide an indication of the demand for land for forestry and other land uses (Global Forest Resources Assessments, 2010)

## **1.1 Statement of Problem**

Nigeria falls short of the basic standard of acquiring regular and up to date data on the forest resources. The available information on the forests is either obsolete or based on extrapolation from very old data. With the last national forest inventory dating back to 1997, most of the information documented may not properly reflect the actual situation but merely indicative. The total forest area in Nigeria has been decreasing at an increasing rate and the demand for wood raw materials by industries and citizens in recent times in Nigeria has outstripped the production capacity of both the natural and plantation forests.

Brilliant forest policies have been formulated in Nigeria over time, a case in point is the approved national forest policy (2006) and the state forest policies of the state department of forestry in Southwestern Nigeria but the paradox is that only a negligible part of the policy are implemented. To this end there is no apparent and significant forestry development to show for this. This suggests that mere formulation of forest policy should become not the major issue but rather their effective implementation, as it is only effectively implemented policies that can bring about forestry development. There is policy failure when there is a sizable gap between a policy decision and its implementation. Implementation problem do arise from the policy itself since they emanate from government rather “than from the target groups. By this, it means that planning is top-down and by implication, the target beneficiaries who are the stakeholders are not allowed to contribute to the formulation of the policy that affect their lives. Hence, the resultant effect of the weakness in the decision-making apparatus of the government.

In the protection of existing forest reserves, forest law enforcement has been very challenging, especially where forest guards and security operatives have been said to be constantly involved in issuing false permits in cooperation with other officials in the Ministry of Agriculture and Natural Resources. Both forest guards and officials have also been reported to be conniving and giving permission to foreigners to illegally control the forest through local agents. Many have lost their lives to real forest guards who are up and doing their work as a result of forest offenders having tip-offs about scheduled checks and raids.

Poor governance in the forest sector impedes its optimum development. Various factors combine to negate good forest governance which is the absence of accountability, respect for the rule of law, effectiveness, transparency, efficiency and participation. These are evident in the ineffectiveness of checkpoints manned by forest authorities, non-compliance with rules and regulations which is frequently either not detected, or, if detected, the necessary corrective actions and penalties are often not enforced or avoided through corruption. Wrong doing in forests do take a number of forms. It involves the ignoring of rules and regulations, the application of corrupt practices, the abuse of power, and the illegal harvesting and trading of products. It also involves the illegal conversion of forests into other land uses (deforestation) and

the irrational use of forests in general (leading to forest degradation). Corruption as a sign of poor governance is a common phenomenon in most African countries.

The source of timber is gradually being restricted to the forest reserves and worst still, the reserves are being depleted unabatedly. Forest plantation establishment in Southwestern Nigeria is predominantly a government affair, few individuals are involved. This was corroborated by Ajewole *et al.*, (2005) who stated that private investments in forestry has been at an all-time low ebb because of lack of some micro-economic policy incentives such as tax relief, low interest in long term loan and facilitation of acquisition of land.

## **1.2 Research questions**

- What is the extent of forest cover in the selected forest reserves between 1987 and 2017 in Southwestern, Nigeria?
- What are the institutional frameworks of forest governance in Southwestern Nigeria?
- Is there forest law enforcement in conserving the existing forest reserves in Southwestern, Nigeria?
- What are the factors negating good forest governance in Southwestern, Nigeria?
- Are forestry stakeholders willing to own forest plantation in Southwestern, Nigeria?

## **1.3 Main Objective**

- The main objective of this study was to assess forest governance with a view to ensuring sustainable forest management in Southwestern, Nigeria.

### **Specific Objectives are to:**

- determine the extent of forest cover in selected forest reserves between 1987 and 2017 and
- examine the institutional framework of forest governance;
- assess forest law enforcement in conserving the existing forest reserves;
- identify the factors negating good forest governance;

- investigate stakeholders' willingness to own forest plantation in Southwestern, Nigeria.

#### **1.4 Justification**

The extent of forest cover is of utmost importance to any competent forest manager either privately owned or public forest reservation area. Forest size information based on up-to-date data allows for the proper preparation and use of and management of forest resources. Successful forest managers track changing conditions and make wise choices for sustainable management of forests. Sustainable forest management can flourish where sufficient inventory data for the creation and periodic review of forest management and work plans are available. Only if forest policy and management decisions are based on a monitoring framework that provides up-to-date and statistically credible data on forest resources and their changes can sustainability be achieved in forest management. Knowledge of the extent and trends in forest cover is clearly a key element of good forest governance. Geospatial records provide forest managers with baseline information for evaluating plans. The extent or size of the forest reveals a good governance or otherwise. Information on the extent of forest cover in the forest reserves in Southwest Nigeria is scarce.

The existence of policy, with adequate provision for planning, decision-making processes and stakeholders' participation; which provide institutional framework is fundamental facets of forest governance. The preponderance of forest policy is to provide guidelines for forest managers which in turn would be a catalyst for the management and harvesting of forest resources in a sustainable manner. Expansive stakeholder involvement becomes very necessary in order to ensure sustainability in forest management.

Forest crime is not only limited to illegal harvesting as implied by forest law enforcement where illegal harvesting is the only preoccupation of the government in cubing this menace . Enforcement expectedly should not only target field workers in the forest sector but should extend to all the persons within the value chain in the forestry industry cutting across from the field to the office workers. For a forest law enforcement strategy to be good, it should be

expansive and diverse, with consideration for adequacy of sanctions, adequacy of staff for effective coverage, adequacy of equipment, effective coverage of assigned land area, effective measures for crime prevention, effective measures for crime detection, effective measures for crime suppression, regular investigation of serious forest crimes, extent of coverage against forest crime with modern techniques for detecting, preventing and vigorous suppression of crimes.

Emphasis on silvicultural aspect of forestry is well appreciated in Nigeria but its success or otherwise is largely dependent on governance factors. Factors militating against good forest governance in Southwestern Nigeria will be addressed. The study will expose good forest governance principles that should be put in place to ensure sustainable forest management.

Early work on plantations in Nigeria started at the beginning of the 20th century in Southwestern, Nigeria. This region should still maintain her leadership role and a force to reckon with as far as forest plantation establishment is concerned in Nigeria. Southwestern Nigeria is a rapidly developing region, with a huge demand for wood and its products. The wake of privatization in Nigeria is a demonstration of the conviction that the government is a bad manager and so, common property such as the forest is better-off in the hands of private individuals. A segment of the society recognized as forestry stakeholders have some form of involvement. There is therefore a dire need to ascertain their challenges and willingness to establish private forest plantation given the necessary support.

The beneficiaries of this study will cut across all forest users both directly and indirectly. These will include rural and urban dwellers, forest managers, forest officials, policy makers, researchers in forestry, Non-Governmental Organisations interested in forestry and generality of the people who rely on forest and / or forest products in one way or the other. The outcome of this study will articulate the missing link in the operation of the state departments of forestry, Southwestern, Nigeria from forest policy formulation to implementation of their task. This study therefore is intended to recommend the outcome of the assessment of forest governance for the promotion of sustainable forest management in Southwestern, Nigeria.

## **1.5 Scope of the study**

The study was conducted in Ekiti, Lagos, Ogun, Ondo, Osun and Oyo states. These six states are contiguous in terms of boundary and they are located in the same geo-political zone in Nigeria. Respondents were drawn among the state departments of forestry, saw millers, timber contractors, plank dealers, private forest plantation owners and community dwellers in adjoining forest reserves. The study also employed the use of Landsat Satellite imagery in Ogun River, Ogbese, Ikere, Aworo, Olokemeji, Oluwa, Akure, Shasha, Ago-Owu, Onigambari and Osho forest reserves; all domiciled in Southwestern, Nigeria from the year 1987 to 2017.

## CHAPTER TWO

### LITERATURE REVIEW

#### 2.1. Governance

The root word governance is the Greek word “kubernan” meaning “to pilot or steer”. An agreement of the precise definition of governance has not been reached by scholars in the field. Governance was once used to imply government but it becomes delineated as governance encompasses other stakeholder participation, like civil society and Non Governmental organizations that are involved in policy formulation, administration and implementation. Governance can be used in several contexts such as corporate governance, international governance, national governance and local governance. This term is likely to be treated as a synonym for government (Kjaer, 2004).

However, the concept of governance is distinct from government, because it involves a complex interplay among various stakeholders in the public arena (Clayton, 1994). Many scholars characterize governance as a "new governance process in which, through mutual interaction, a variety of actors govern the public arenas" (Kjaer, 2004), while some author's concept of governance emphasizes its utility and components (Rhodes, 1996). Other authors conceptualize governance in the context of its “shifting paradigms and discourses, they highlight the processes of change from governance by government, to governance with government and governance without government” (Rosenau, 2002 and Rhodes, 1996).

Governance can be conceptualized as a mechanism requiring the involvement of multiple actors to influence decision-making, including state, private and civil society. It is a multi-actor,

interactive decision-making mechanism that includes power resource mobilization and deployment. This understanding is in line with the ideas of working definitions proposed by Bila *et al.* (2006), using governance as a term to describe the informal and formal rules and the relationships of power that decide who makes decisions, about whom and how those decisions are taken at the global, national and local levels of society. Put clearly, "governance" means: the decision-making process and the process by which decisions are taken (or not implemented).

## **2.2 Good governance**

By setting down a collection of values and beliefs in the form of good governance principles or codes, many scholars have described good governance. Examples include calls for transparency, fairness, efficiency, accountability and equity in decision-making and policy implementation (FAO and PROFOR, 2011). Good governance ensures that corruption is minimized, that minority opinions are taken into account and that the voices of the most vulnerable in society are heard in decision-making, so that the larger majority of society is still satisfied. Also, it is open to the present and future needs of society.

Blair (2000) claimed that "what is good has not reached a global consensus so far, as the debate is ongoing, attracting social theory among other schools of thought, thereby snowballing the complexity of the term." Decentralisation and devolution are at the intersection of several debates on good governance and development in the sense of social theory. It is claimed that decentralization would bring politics closer to the people, increase policy effectiveness, and strengthen sub-national democratic controls and balances; which are also essential prerequisites for good governance (Ribot *et al.*, 2010).

**Table 2.1: Principles of Good Governance**

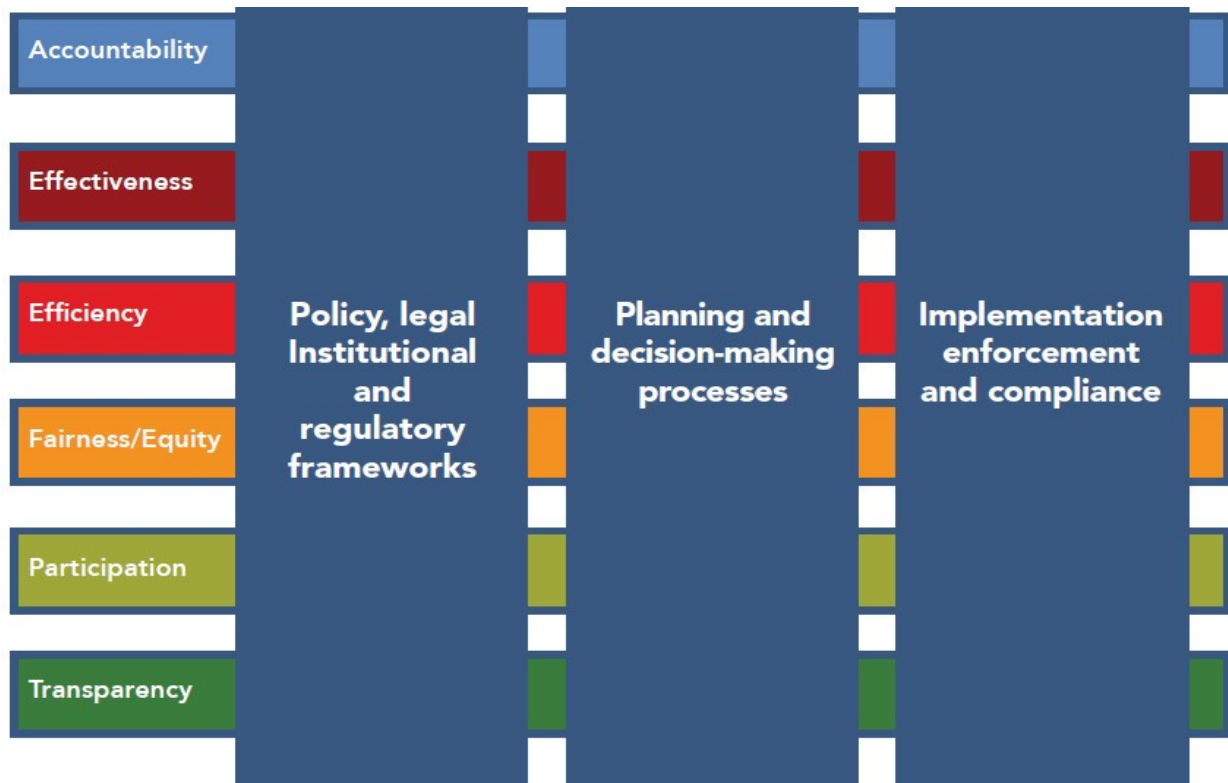

| Variables                   | Definition/Description   |
|-----------------------------|--|
| Accountability              | People and institutions should be accountable for their actions.   |
| Effectiveness               | Governance mechanisms should achieve the ends they are intended to achieve.  |
| Efficiency                  | Governance should work with a minimum of resources.  |
| Participation               | All interested people should have an opportunity to be consulted / participate in key decisions affecting forests. |
| Respect for the rule of law | Good governance requires fair legal frameworks that are enforced impartially.                                      |
| Transparency                | Information about forests and how they are governed should be reasonably available to all.                         |

### **2.3 Forest governance**

Forest governance comprises all formal and informal, public and private regulatory structures, i.e. institutions consisting of rules, norms, principles, decision procedures, concerning forests, their utilization and their conservation, the interactions between public and private actors therein and the effects of either on forests. Forest governance is a technique by which officials and institutions acquire and exercise authority in the management of forest resources. It entails application of government regulation and law enforcement for sustainable management within the political, organizational and cultural frameworks through which diverse interests in the resources are coordinated and controlled (Weiland and Deduerwaerdere, 2010). Forest governance process includes a lot of actors from statutory and customary government, the private sector and civil society, which are operating at different levels of scale.

According to Larson and Petkova (2011), achieving good governance dominates today's development agenda. Good forest governance means that laws and rules are enforced equitably. Corruption and illegal logging, and particularly the vested interests behind them, foster bad governance and obstruct efforts to promote sustainable forest practices. Hence, it is through good forest governance sustainable forest management is ensured.

Source: FAO and PROFOR (2011)

**Figure 2.1:** Pillars and Principles of Forest Governance

Forest is a natural resource that serves the interest of all stakeholders. Democracy popularly conceived as a people-centric phenomenon succinctly describes the forest governance as the management of the forest estate by the people for the people. Like democracy with varying forms and distinctions that are structured by cultures of the people practicing it, forest governance approaches have varied across countries. Democracy in whatever forms it is practiced is aimed at good governance.

Good forest governance is characterized by the prevalence of the rule of law, low levels of corruption, robust institutions, high competence of officials and other functionaries who implement rules, willingness to address forest sector issues, sanctity of critical legal elements such as enforcement of property right and voluntary contracts, etc. (World Bank, 2008). Good forest governance supports and encourages the implementation of sustainable forest management. At the same time, forest managers who implement sustainable forest management can themselves help bring about better forest government. According to World Bank (2004) “poor forest governance can have significant negative impacts on development outcomes in all the three pillars of the World Bank forest strategy: the environment, poverty reduction and social development and economic growth”.

In view of the forest's significance and contribution to virtually every facet of human life, forests have a range of features that make them problematic from a governance point of view.

The essence of the resource, according to Brown *et al.* (2002), is the nature of the rights and value of forest resources. Despite these obstacles, Ros-Tonen and Kusters (2011) are of the opinion that improved governance at local, national and global levels is reflected by the forest sector.

According to Brown *et al.* (2002), these are the nature of the resource the nature of the rights and the value of forest resources. In spite of these challenges, Ros-Tonen and Kusters (2011) opined that the forest sector represents improved governance at the local, national and the global levels. Governance, or lack of it, is a core problem in forestry that affects millions of people at all levels engaged in forest-related livelihood activities. Good forest governance is therefore important for

protecting the livelihoods of people, improving their well-being and protecting them from the adverse effects of illegal logging.

#### **2.4 Review on selected major forest countries with federal systems of government on forest governance**

A review of the federal governments of Australia, Canada, Brazil, India, Malaysia, Russia, Nigeria and the United States of America by Gregersen *et al.* (2004). (Major decentralization projects have been pursued by Bolivia, Indonesia, and Nepal and are thus also included, even though they do not have federal government systems):

- Over 60 percent of the world's forests are domiciled in these countries.
- Mode of ownership of forest land is the government with exception to the United State.
- In countries such as Australia, Canada, Malaysia, and Nigeria, the state or province that owns the majority of all forest lands.
- Federal ownership is substantial even in the United States where the federal government owns about 35 percent of all forests, the states own about 5 percent and the private sector owns the majority, about 60 percent is private property.
- The number of other industries active in the forest industry is in the hundreds.
- Nigeria and Russia, where the central/federal government "owned" a majority of the forest land, tend to be countries where central agencies and public forest land control are weak.
- Canada and India where a majority of forest lands are publicly owned, but "owned" by state, or provincial level governments (e.g.) tend to have a better record of effectively controlling the public forest estate.
- Proper management of inter-sectorial and interagency linkages in most federal nations is challenging and often not satisfactorily accomplished.
- In countries where most forest land is owned by the central government (Indonesia, Nepal, Nigeria and Russia), the relative power of the federal public administration of the forest is low, and forest agencies have historically been unable to control the key course of events.

- The relative power of the federal public forest administration is poor in countries where the central government controls most forest lands (Indonesia, Nepal, Nigeria and Russia), and forest agencies have traditionally been unable to control the key course of events.
- Weak administrative and technical capacity at the local government level, e.g., in the cases of Bolivia, Brazil, India, Indonesia and Nigeria, often prevented effective function delivery.
- Nigeria clearly highlights the reality that it is impractical to decentralize administrative functions without having commensurate financial support.

## **2.5 Challenges of good forest governance in Africa**

Strong forest governance in Africa is impeded by a variety of factors, according to Counsell (2009). The following include these:

- Inadequate knowledge of most of the main forest resource data is available,
- As a result, external drivers have strongly shaped forest governance and forest management paradigms, policies and programs have often been skewed to the demands of foreign actors rather than what has been important or useful to local stakeholders.
- The vision for forests lacks clarification and there is also a lack of appropriate policy and regulatory structures.
- In general, the more forests play a role in producing hard currency earnings, the less participatory the processes of government are, and the more direct the role the state plays.
- There is a lack of clarification about the laws and procedures of tenure and rights.
- There is tension between the claims of the state to possession and systems of traditional/customary rights.
- In organizational decisions concerning forest resources, 'governmental interference' is direct and indirect.
- Everywhere on the continent, there are a few models of good forest governance and very few others to choose from.
- Overall, it is hard to escape the conclusion that there has always been an inverse relationship between government involvement in the forestry sector in much of Africa and good governance.

## **2.6 Continental-Scale of Forest Area and Gross Forest Cover Loss**

Asia and South America are the continents with the largest area of forest cover, each with one-quarter of the global total. North America has the greatest area of (GFCL), followed by Asia and South America. North America alone accounts for nearly 30% of global GFCL and features the highest proportional GFCL of 5.1%. Africa has the lowest proportional GFCL of 0.4%, reflecting a lower overall use of forests for commercial development. South America has the largest remaining intact forests within the tropics, areas that are under increasing pressure from agro-industrial development (Hansen, 2010).

**Table 2.2:** Continental-scale forest cover and GFCL, 2000–2005

| Continent         | Year 2000 forest cover (km <sup>2</sup> ) | % of total forest cover | Year 2000 - 2005 GFCL (km <sup>2</sup> ) | GFCL as % of forest cover | % of total GFCL |
|-------------------|---|-------------------------|--|---------------------------|-----------------|
| North America     | 5,829,000                                 | 17.8                    | 295,000 (15,000)                         | 5.1                       | 29.2            |
| Asia              | 8,442,000                                 | 25.8                    | 240,000 (28,000)                         | 2.8                       | 23.7            |
| South America     | 8,414,000                                 | 25.7                    | 228,000 (21,000)                         | 2.7                       | 22.6            |
| Africa            | 5,635,000                                 | 17.2                    | 115,000 (21,000)                         | 2.0                       | 11.4            |
| Europe            | 3,099,000                                 | 9.5                     | 86,000 (11,000)                          | 2.8                       | 8.5             |
| Australia/Oceania | 1,268,000                                 | 3.9                     | 47,000 (13,000)                          | 3.7                       | 4.6             |
| Total             | 32,687,000                                | 100                     | 1,011,000 (45,000)                       | 3.1                       | 100             |

**Source:** Hansen, 2010

## 2.7 Forest policy

The word "policy" is not specifically defined according to FAO (2010) "but is used on various occasions in various ways." Often, "a course of action adopted and pursued" may mean. It is possible to specifically state a policy or not. It can also be scheduled or it can occur by apparent actions. It is therefore often perceived either as a logical mechanism focused on deliberate objectives and strategies or as a function of a set of decisions resulting from political action. In any event, to be effective, a policy needs to offer clarity and a sense of direction over a certain period of time.

A policy document is a series of painstaking activities. FAO (2010) further described these facts:

- A national forest policy is an adopted shared vision and goals negotiated among stakeholders for the forests and trees of a country.
- Forest policy priorities resolve key social concerns and align with the development goals of a nation.
- Initiation of policy requires a clear understanding of the nation's local situation.
- Proper planning, including communication and capacity building, leadership support and sound information on forest status and future trends and the social, political, economic, environmental and technological factors that decide their use, is significant.
- Participation by stakeholders is important.
- Different forestry priorities must be discussed in the production of forest products.
- Workable strategies, with implementation in mind, must be planned.
- Forest policy communication is essential for awareness and comprehension of it.
- A high degree of government commitment to the current forest policy and implementation strategy is vital.
- On a regular basis, forest policy should be driven.

## **2.8 Sustainability in forest management**

Sustainability in forest management has been defined as “the stewardship and use of forests and forest lands in a way, and at a rate, that maintains their biodiversity, productivity, regeneration capacity, and vitality and their potential to fulfill, now and in the future, relevant ecological, economic, and social functions at local, national, and global levels” (MCPFE,1993). Sustainable forest management has also been described as forestry’s contribution to sustainable development. This is development which is economically viable, environmentally benign and socially beneficial, and which balances present and future needs. Seven key components of sustainable forest management (SFM): afforestation and reforestation project in order to increase the forest resources, biological diversity in strengthening and expanding non forest components such as wildlife and NTFP’s, forest health and vitality through silvicultural practices, productive functions through funding and silvicultural practices, protective or environmental functions, socio-economic functions of forest to sustainable livelihoods of forest dependent communities/general public and institutional framework support.

The core goal of the CPF is to “increase cooperation and coordination on forests” (CPF, 2010) this is accomplished by collaborating with fourteen (14) International organizations and secretariats with substantial programmes on forests such as CIFOR, FAO, ITTO, IUFRO, CBD, GEF, UNCCD, UNFF, UNFCCC, UNDP, UNEP, the World Agroforestry Centre, the World Bank and IUCN (CPF 2010). The CPF Task Force on Streamlining Forest-Related Reporting analyzed the nine criteria and indicators processes and found that all shared in common “seven thematic areas of sustainable forest management”. These thematic areas have since been endorsed by the UNFF, the International Conference on Criteria and Indicators in Guatemala and the FAO Committee on Forestry (International Conference on Criteria and Indicators). Likewise, the FAO/ ITTO Expert Consultation on Criteria and Indicators formally recognized the importance of the seven thematic areas in facilitating international communication on forest-related issues.

## **2.9 Benefits of implementing sustainable forest management**

FAO (2013) highlights the benefits of implementing the seven key components of sustainable forest management:

- forms an overarching framework for forestry development;
- heightens political commitment to SFM at the national level;
- increases focus on the social, economic and environmental contributions of forests at the national level and to internationally agreed development and environmental goals
- provides a single framework for the coordination of national and international forest related actions
- provides a holistic and comprehensive “360 degree” view of forests that reduces the fragmentation of efforts and programmes;
- provides a tool for assessing progress towards SFM at the national level.

## CHAPTER THREE

### METHODOLOGY

#### 3.1 The Study area

The study area is Southwestern Nigeria, which consists of Lagos, Ogun, Oyo, Osun, Ondo and Ekiti States (Figure 1). It lies between longitude  $2^{\circ} 31'$  and  $6^{\circ} 00'$  East and latitude  $6^{\circ} 21'$  and  $8^{\circ} 37'$  North having land area of  $77,818 \text{ Km}^2$  with a projected population of 38,257,260 in 2016 (NBS, 2007).

Figure 3.1: Map of Nigeria showing the study area

#### 3.2 Study Design

The study is socio-economic and observational in nature.

### **3.3 Data collection and procedures**

Landsat satellite images (1987, 1997, 2007 and 2017) from US Geological Survey were utilized. The study area is located in the Landsat paths 190/191 and row 55. The pixel sizes of the images were 30×30m (Chander, 2003). All the images were obtained in the same season (dry). Also, field work, with an assessment of forest governance objectives, was conducted using questionnaire to generate data from forestry stakeholders domiciled in Southwestern, Nigeria. Respondents were forest officers, forest superintendents and forest guards, saw-millers, timber contractors, plank dealers, private forest plantation owners and community dwellers adjoining forest reserves. Personal observations were used to augment data generated through questionnaire. Also, Secondary data was obtained from state forestry offices, technical publications, journals, research reports, library, internet and other relevant literature that supplements the primary data. A common practice in estimating manpower requirements for forestry is to develop empirical norms of technical staff per unit area of forest. The estimated requirements represent the minimum number of staff of each category that should be available to cater for the management of the forest reserves. Estimates of professional staff requirements are then derived from the numbers of technical staff using supervision ratio. For each of the state departments in southwestern Nigeria, the empirical norm; 1 Technical staff/300ha, while Professional/Technician ratio of 1: 4 in forest plantation management for selected forest reserve was adopted (FAO, 1970). According to O'Toole and Meier (2009) staff shortfall (deficit) estimation is a management tool used to determine the exact percentage of manpower shortage. Below fifty percent there is no need for employment of additional staff, at fifty percent management may or may not employ because half of the workforce required are available; above fifty percent there is a need to increase the staff strength for optimal performance and to prevent the overworking of the available staff caused by inadequate manpower staff shortfall percentage which indicates the magnitude of staff deficiency. The higher staff shortfall percentage, the urgent the need for additional recruitment and vice versa.

### **3.4 Sampling Size**

Six sets of structured questionnaire were administered to the specified respondents and a check list was administered to each state in which a representative in the various headquarters filled questionnaire based on the existing state record. The six sets of structured questionnaire were administered with oral interviews to 37 professionals, 57 technical staff, 81 uniform staff, 82 timber contractors 152 saw-millers, 110 plank dealers, 40 private forest plantation owners and 149 community dwellers (these are people living within 3km radius of the Forest Reserves boundaries) in all the six states. A total of 708 respondents were selected in the study area. The first set of questionnaire was administered to forest official within professional and technical cadre, the second set of questionnaire was to forest officials within the Uniform staff cadre, the third set to timber contractors and saw-millers, the fourth set to plank dealers, the fifth set to private forest plantation owners while the sixth set to community dwellers in adjoining forest reserves. Diaw *et al.* (2002)'s sampling method was used, were ten, five, two and half percent sampling intensity were used to choose respondents from 500 and below, between 500 and 1000 and 1000 and above respectively with exception to professional and technical staff where 50 percent sampling intensity was used and in Lagos State where total enumeration was carried out considering their limited number of staff.

### **3.5 Sampling Intensity**

Fifty percent of professional and technical staff was randomly selected across the six states. However, 10% sampling intensity was applied to uniformed staff, saw millers, timber contractors and plank dealers, respectively. One major plank market each was selected from across the state and 2.5% of the plank dealers from each market were selected. Ten percent of the registered private forest plantation owners were selected across the state. Two forest reserves were choosing from each state. Ten percent of each of the community dwellers in adjoining forest reserves was chosen.

**Table 3.1: Total Number of Sampled respondents in the Study Area**

| <b>State/Respondents</b> | <b>Ekiti</b> | <b>Lagos</b> | <b>Ogun</b> | <b>Ondo</b> | <b>Osun</b> | <b>Oyo</b> | <b>Total</b> |
|--------------------------|--------------|--------------|-------------|-------------|-------------|------------|--------------|
| Professional             | 5            | 6            | 5           | 9           | 7           | 5          | 37           |
| Technical                | 6            | 1            | 15          | 19          | 4           | 12         | 57           |
| Uniformed                | 9            | 5            | 29          | 19          | 10          | 9          | 81           |
| Timber Contractors       | 10           | 5            | 16          | 17          | 19          | 15         | 82           |
| Saw millers              | 20           | 25           | 18          | 29          | 32          | 28         | 152          |
| Plank sellers            | 10           | 13           | 23          | 21          | 10          | 33         | 110          |
| Private Plantations      | 7            | 3            | 8           | 10          | 4           | 8          | 40           |
| Village dwellers         | 26           | 20           | 28          | 17          | 26          | 32         | 149          |
| <b>TOTAL</b>             | <b>93</b>    | <b>78</b>    | <b>142</b>  | <b>141</b>  | <b>112</b>  | <b>142</b> | <b>708</b>   |

### 3.6 Data analysis

The data obtained were subjected to descriptive and inferential analysis. Tools such as tables, percentages and frequency were used in the presentation of the findings as descriptive statistics while Logistic regression and chi-square test inferential statistics were used in the presentation of the findings of the study. Details of the analytical tools used in the data analyzed are presented below:

#### Logistic regression

The logit of a response  $p$  between 0 and 1 is given as:

$$\text{Logit}(p) = \log(p) - \log(1 - p)$$

The simplest form of logit model is expressed as:

$$\text{Logit}(p_i) = a + bx \dots\dots\dots \text{Equation 1}$$

Where  $x_i$  = independent variable

$p_i$  = probability of respondent indicating presence or absence

The factors negating Good Forest Governance (GFG - Dependent variable) were investigated (Presence = 1; Absence = 0)

Factors investigated {Independent variable} were

Lack of accountability (*LACC*), Ineffectiveness (*IEFV*), Inefficiency (*IEFC*), Lack of respect for the rule of law (*LRRL*), Lack of participation (*LPAT*) and Lack of transparency (*LTRC*)

The Chi-square test is a non-parametric test used to test for independence or association of variables in contingency tables, given by

$$X^2 = \sum (O_{ij} - E_{ij})^2 / E_{ij}$$

Where chi square value =  $X^2$

$$X^2 = \sum (O_{ij} - E_{ij})^2 / E_{ij} \dots\dots\dots \text{Equation 2}$$

- $\sum$  = Sum
- $O_{ij}$  = Observed cell frequency
- $E_{ij}$  = Expected cell frequency
- Degree of freedom (df) =  $(r-1)(c-1)$ ,
- Where  $r$  = number of rows and  $c$  = number of columns

Planning, decision-making, stakeholders' participation and perception on enforcement were tested.

## **CHAPTER FOUR**

### **RESULTS**

#### **4.1 Respondents in the study area**

Table 4.1 Indicated that 13.1% of the respondents were from Ekiti state, 11% of the respondents were from Lagos state, 20.1% of the respondents were from Ogun state, 19.9% were from Ondo state, 15.8% were from Osun and 20.1% respondents from Oyo state.

#### **4.2 Categories of Respondents in Southwestern, Nigeria**

Table 4.2 showed that 5.09% respondents were professional staff, 8.19% of the respondents were technical staff, 11.44% of the respondents were uniform staff, 21.47% of the respondents were saw-millers, 11.58% of the respondents were timber contractors, 15.54% respondents were plank dealers, and 5.64% respondents were private forest plantation owners while 21.05% respondents were community dwellers.

#### **4.3 Information on Demography of Respondents in Southwestern, Nigeria**

Table 4.3 indicated that majority of the respondents were males (82.6%). About 30% of the respondents were between 41 – 50 years old (the largest age range), while 1% were between 21 – 30 years old (the least age range). About 5% were older than 70 years old. It also showed that 11.3% had no primary education, 22.3% had primary education, 30.1% had secondary education, 12.3% had diploma, 0.8% had National Certificate Examination, 8.9% had Bachelor's degree, and 2% had Master's degree while 0.1% had Ph.D.

#### 4.4 Community dweller's State of Origin

Table 4.4 revealed that higher percentage of the respondents were from the area of study; 21.48% in Oyo, 16.77% in Ogun, 14.09% in Osun, 10.74% in Ondo, 6.04% in Ekiti, 4.03% in Lagos, while Kogi (9.4%) and Benue (7.38%) were the highest percentages outside the study area.

**Table 4.1: Number of Respondents per State**

| State        | Frequency  | %             |
|--------------|------------|---------------|
| Ekiti        | 93         | 13.1          |
| Lagos        | 78         | 11.0          |
| Ogun         | 142        | 20.1          |
| Ondo         | 141        | 19.9          |
| Osun         | 112        | 15.8          |
| Oyo          | 142        | 20.1          |
| <b>Total</b> | <b>708</b> | <b>100.00</b> |

#### 4.5 Forest cover class and definitions for supervised classification

Table 4.5 showed the forest cover class and definitions for supervised classification for spatial distribution of forest cover types between the year 1987 and 2017 in Southwestern, Nigeria for the three categories that were used; these include built up/bare surface, shrubs and forest.

**Table 4.5: Forest cover class and definitions for supervised classification**

| <b>Forest Cover</b> | <b>Description</b>   |
|---------------------|--|
| Built up            | Residential, commercial, transportation, communications, utilities, and industrial areas |
| Bare surface        | Sandy areas, bare exposed rock, transitional area and open land                          |
| Shrubs              | Cropland and pasture/ grass land   |
| Forest              | Nurseries, Plantation and mixed forest.  |

**Source: Field Survey, 2017**

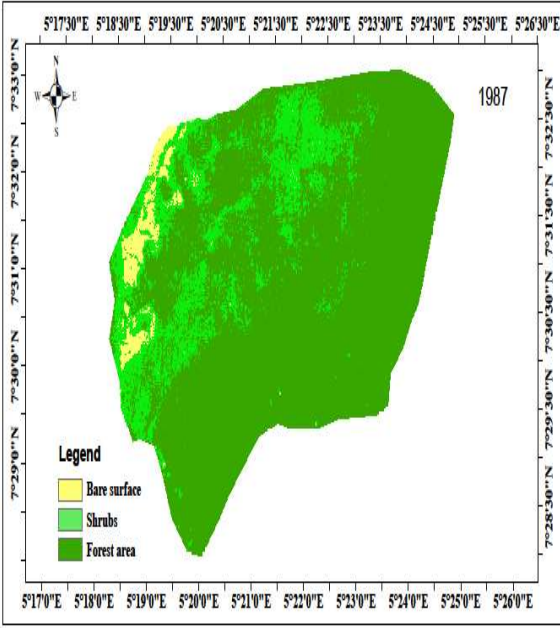

#### **4.5.1 Forest cover type use in Ogbese forest reserve from 1987 – 2017 in Ekiti State**

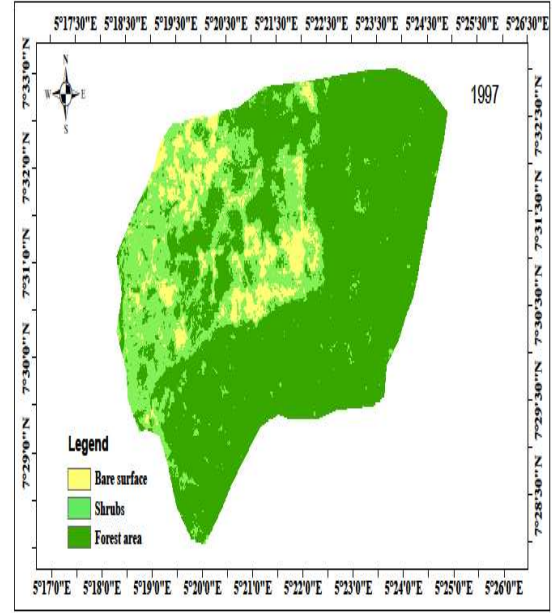

Table 4.6 (as captured in Figures 4.1, 4.2, 4.3 and 4.4 respectively) indicated that built up, shrubs and forest areas constituted 2.11km<sup>2</sup> (2.96%), 13.19km<sup>2</sup> (18.87%) and 56.10km<sup>2</sup> (78.57%) of land area, respectively in 1987; 5.45km<sup>2</sup> (7.63%), 16.88km<sup>2</sup> (23.64%) and 49.084km<sup>2</sup> (68.73%) of land area, respectively in 1997; 3.96km<sup>2</sup> (5.54%), 14.88km<sup>2</sup> (14.10%) and 52.57km<sup>2</sup> (73.62%) of land area, respectively in 2007; and 8.56km<sup>2</sup> (11.98%), 23.33km<sup>2</sup> (32.67%) and 39.52km<sup>2</sup> (53.35%) of land area, respectively in 2017.

#### **4.5.2 Forest cover type use in Ikere forest reserve from 1987 - 2017 in Ekiti State**

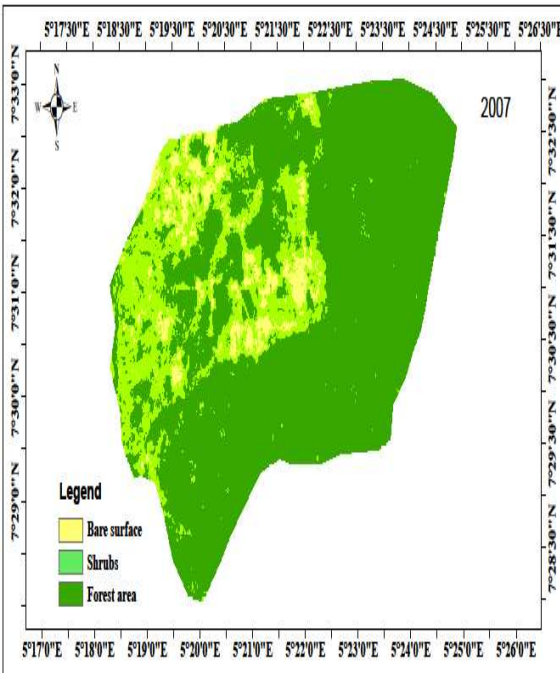

Table 4.6 (as captured in Figures 4.5, 4.6, 4.7 and 4.8 respectively) indicated that built up, shrubs and forest areas constituted 0.83km<sup>2</sup> (6.34%), 4.00km<sup>2</sup> (30.67%) and 8.22km<sup>2</sup> (62.99%) of land area, respectively in 1987; 0.85km<sup>2</sup> (6.48%), 0.87km<sup>2</sup> (6.69%) and 11.33km<sup>2</sup> (86.83%) of land area, respectively in 1997; 0.75km<sup>2</sup> (6.10%), 2.9km<sup>2</sup> (21.90%) and 9.40km<sup>2</sup> (72.00%) of land area, respectively in 2007; and 0.66km<sup>2</sup> (5.08%), 2.79km<sup>2</sup> (21.36%) and 9.60km<sup>2</sup> (73.56%) of land area, respectively in 2017.

#### **4.5.4 Forest cover type use in Aworo forest reserve, Ogun State from 1987 - 2017**

Table 4.6 (as captured in Figures 4.13, 4.14, 4.15 and 4.16 respectively) indicated that built up, shrubs and forest areas constituted 1.71km<sup>2</sup> (0.72%), 0.10km<sup>2</sup> (4.27%) and 224.92km<sup>2</sup> (95.01%) of land area, respectively in 1987; 2.95km<sup>2</sup> (1.25%), 35.18km<sup>2</sup> (14.86%) and 198.59km<sup>2</sup> (83.89%) of land area, respectively in 1997; 5.44km<sup>2</sup> (2.29%), 11.68km<sup>2</sup> (4.94%) and 219.60km<sup>2</sup> (92.77%) of land area, respectively in 2007; and 7.69km<sup>2</sup> (3.25%), 64.42km<sup>2</sup> (27.21%) and 164.61km<sup>2</sup> (69.54%) of land area, respectively in 2017.

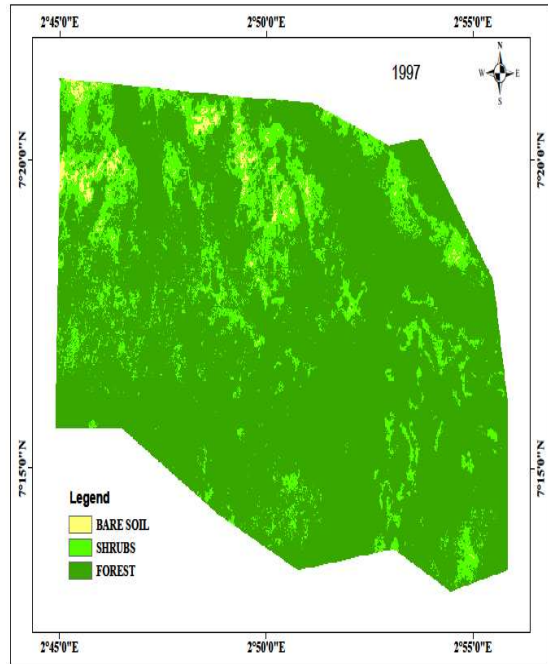

#### **4.5.5 Forest cover type use in Olokemeji forest reserve, Ogun State from 1987 to 2017**

Table 4.6 (as captured in Figures 4.17, 4.18, 4.19 and 4.20 respectively) indicated that built up, shrubs and forest areas constituted 0.37km<sup>2</sup> (0.40%), 3.25km<sup>2</sup> (3.61%) and 86.53km<sup>2</sup> (95.99%) of land area, respectively in 1987; 0.91km<sup>2</sup> (1.00%), 12.94 km<sup>2</sup> (14.36%), 76.30 (84.64%) of land area, respectively in 1997; 1.90km<sup>2</sup> (2.12%) 4.00km<sup>2</sup> (4.44%) and 84.25km<sup>2</sup> (93.44%) of land area, respectively in 2007; 1.14km<sup>2</sup> (1.26%), 15.45km<sup>2</sup> (17.14%) and 73.56km<sup>2</sup> (81.60%) of land area, respectively in 2017.

#### **4.5.8 Forest cover type use in Shasha forest reserve, Osun State from 1987 to 2017**

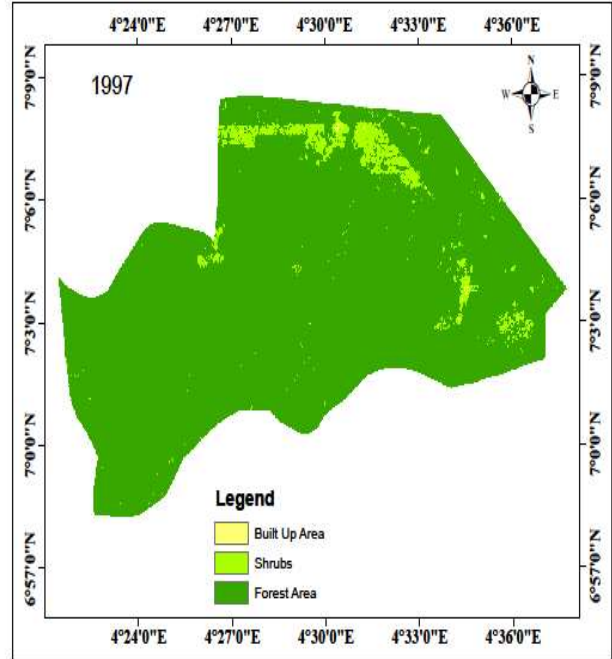

Table 4.7 (as captured in Figures 4.29, 4.30, 4.31 and 4.32 respectively) indicated that built up, shrubs and forest areas constituted  $0.00\text{km}^2$  (0.00%),  $3.56\text{km}^2$  (1.11%) and  $316.12\text{km}^2$  (98.89%) of land area, respectively in 1987;  $0.20\text{km}^2$  (0.06%),  $14.30\text{km}^2$  (4.48%) and  $305.18\text{km}^2$  (95.46%) of land area, respectively in 1997;  $0.23\text{km}^2$  (0.07%),  $23.21\text{km}^2$  (7.26%) and  $296.24\text{km}^2$  (92.67%) of land area, respectively in 2007; and  $0.34\text{km}^2$  (0.11%),  $26.18\text{km}^2$  (8.19%) and  $293.16\text{km}^2$  (91.70%) of land area, respectively in 2017.

#### **4.5.9 Forest cover type use in Ago-Owu forest reserve, Osun State from 1987 to 2017**

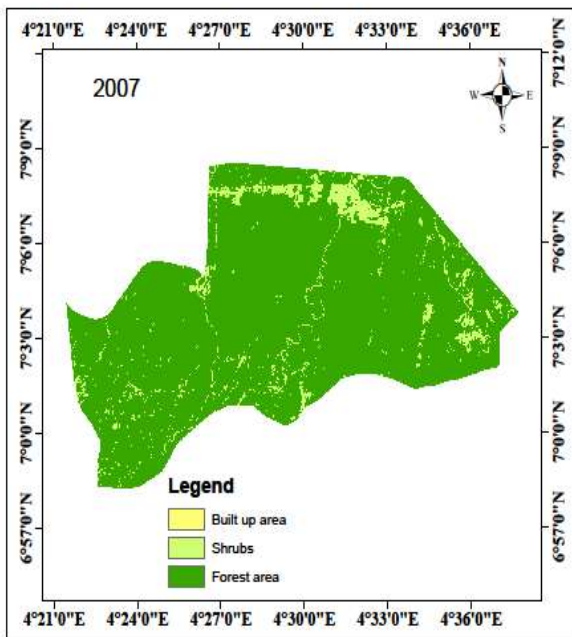

Table 4.7 (as captured in Figures 4.33, 4.34, 4.35 and 4.36 respectively) indicated that built up, shrubs and forest areas constituted  $0.05\text{km}^2$  (0.11%),  $2.70\text{km}^2$  (6.15%) and  $41.17\text{km}^2$  (93.74%) of land area, respectively in 1987;  $0.19\text{km}^2$  (0.43%),  $6.77\text{km}^2$  (15.41%) and  $36.96\text{km}^2$  (84.16%) of land area, respectively in 1997;  $0.44\text{km}^2$  (12.83%),  $8.14\text{km}^2$  (18.53%) and  $35.34\text{km}^2$  (80.47%) of land area, respectively in 2007; and  $2.59\text{km}^2$  (5.89%),  $9.46\text{km}^2$  (21.54%) and  $31.87\text{km}^2$  (72.57%) of land area, respectively in 2017.

#### **4.5.10 Forest cover type use in Gambari forest reserve, Oyo State from 1987 to 2017**

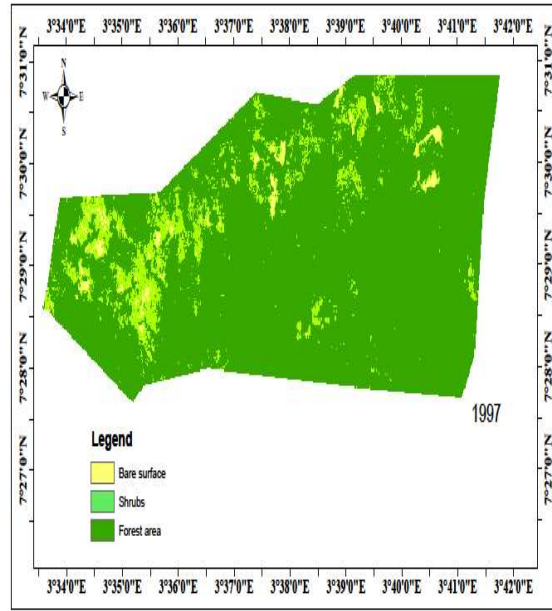

Table 4.7 (as captured in Figures 4.37, 4.38, 4.39 and 4.40 respectively) indicated that built up, shrubs and forest areas constituted 0.41km<sup>2</sup> (0.38%), 5.52km<sup>2</sup> (5.12%) and 101.98km<sup>2</sup> (94.50%) of land area, respectively in 1987; 1.91km<sup>2</sup> (0.84%), 40.84km<sup>2</sup> (37.85%) and 66.16km<sup>2</sup> (61.31%) of land area, respectively in 1997; 2.20km<sup>2</sup> (2.04%), 28.32km<sup>2</sup> (26.25%) and 77.39km<sup>2</sup> (71.71%) of land area, respectively in 2007; and 2.20km<sup>2</sup> (2.03%), 17.37km<sup>2</sup> (16.10%) and 88.34km<sup>2</sup> (81.87%) of land area, respectively in 2017.

#### **4.5.11 Forest cover type use in Osho forest reserve, Oyo State from 1987 to 2017**

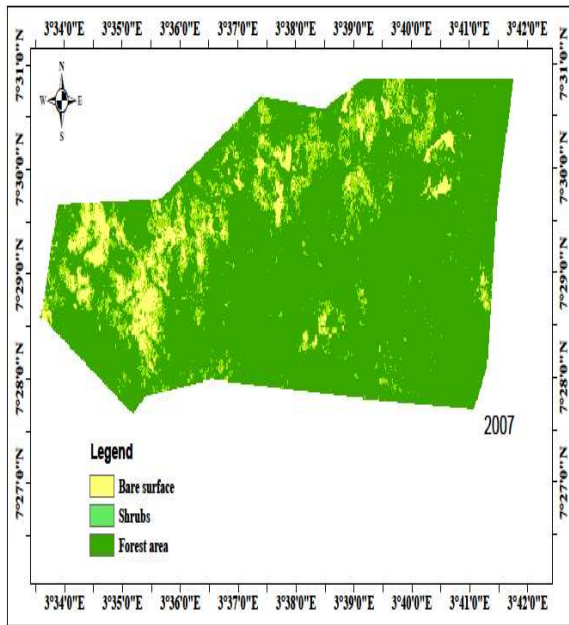

Table 4.7 (as captured in Figures 4.41, 4.42, 4.43 and 4.44 respectively) indicated that built up, shrubs and forest areas constituted 1.27km<sup>2</sup> (1.95%), 3.57km<sup>2</sup> (5.49%) and 60.26km<sup>2</sup> (92.56%) of land area, respectively in 1987; 1.19km<sup>2</sup> (1.83%), 6.12km<sup>2</sup> (9.40%) and 57.79km<sup>2</sup> (88.77%) of land area, respectively in 1997; 4.36km<sup>2</sup> (6.70%), 6.93km<sup>2</sup> (10.63%) and 57.79.km<sup>2</sup> (73.07%) of land area, respectively in 2007; and 4.90km<sup>2</sup> (7.52%), 31.02km<sup>2</sup> (47.81%) and 29.08km<sup>2</sup> (44.67%) of land area, respectively in 2017.

#### **4.5.12 Extent of Forest Cover in Forest Reserves from 1987, 1997, 2007 to 2017**

Figure 4.45 indicated the extent forest cover in Ogbese forest reserve as 56.1km<sup>2</sup>, 49.08km<sup>2</sup>, 52.57km<sup>2</sup> and 39.52 km<sup>2</sup>; Ikere forest reserve as

8.22km<sup>2</sup>, 11.33km<sup>2</sup>, 9.4km<sup>2</sup> and 9.6km<sup>2</sup>; Ogun River forest reserve as 12.78km<sup>2</sup>, 11.29km<sup>2</sup>, 5.24km<sup>2</sup> and 52.2 km<sup>2</sup>; Aworo forest reserve as 224.92km<sup>2</sup>, 198.59km<sup>2</sup>, 219.6km<sup>2</sup>, and 164.61km<sup>2</sup>; Olokemeji forest reserve as 86.53km<sup>2</sup>, 76.3km<sup>2</sup>, 84.25km<sup>2</sup>, and 73.56km<sup>2</sup>; Oluwa forest reserve as 781.54km<sup>2</sup>, 720.27km<sup>2</sup>, 696.43km<sup>2</sup>, and 686.73km<sup>2</sup>; Akure forest reserve as 27.82km<sup>2</sup>, 51.48km<sup>2</sup>, 22.78km<sup>2</sup>, and 23.26km<sup>2</sup>; Shasha forest reserve as 316.12km<sup>2</sup>, 305.18km<sup>2</sup>, 296.24km<sup>2</sup> and 293.16km<sup>2</sup>; Gambari forest reserve as 101.98km<sup>2</sup>, 66.16km<sup>2</sup>, 77.39km<sup>2</sup>, and 88.34km<sup>2</sup> and Osho forest reserve as 60.26km<sup>2</sup>, 57.79km<sup>2</sup>, 53.81km<sup>2</sup> and 29.08km<sup>2</sup> from 1987, 1997, 2007 and 2017 respectively.

**Figure 4.45: Extent of Forest Cover (ha) in Forest Reserves from 1987, 1997, 2007 to 2017.**

#### **4.5.13 Forest cover size, change and percentage change from 1987 - 2017**

Table 4.8 indicated the forest cover change and percentage change in Ogbese, Ikere, Ogun River Aworo, Olokemeji, Oluwa, Akure, Shasha, Ago-Owu, Onigambari, Osho were, -16.58 km<sup>2</sup> and -29.55%, 1.38 km<sup>2</sup> and 16.79%, -9.85km<sup>2</sup> and -65.28%, -60.31 km<sup>2</sup> and -26.81%, -12.97 km<sup>2</sup> and -14.99%, -94.81 km<sup>2</sup> and -12.13%, -4.56 km<sup>2</sup> and -16.39%, -22.96 km<sup>2</sup> and -7.26%, -261.29 km<sup>2</sup> and -89.13%, -13.64 km<sup>2</sup> and -13.38%, -31.18 km<sup>2</sup> and -51.74% .

## **4.8.0 Planning in Forest Resources Management Southwestern Nigeria**

### **4.8.1 Existence of planning**

Table 4.17 showed that in Ekiti, Lagos, Ogun, Osun and Oyo states (100%) except in Ondo state, agreed that planning exist in the state departments of forestry while 92.9% in Ondo state conceded to this fact, with an exception of 7.1% who are of the opinion it does not exist. In Southwestern Nigeria, the aggregated data showed that 98.8 percent of respondents acceded to the evidence that there is planning while 1.2 percent disagreed. The chi-square test (Table 4.18) revealed that existence of planning have significant relationship with forest policy institutional framework support ( $\chi^2 = 11.677$ ,  $p < 0.05$ ).

### **4.8.2 Update on Plans.**

Table 4.17 showed all the respondents in Ogun and Osun states (100%) while 85.7%, 82.1%, 81.1% and 58.8% in Lagos, Ondo Ekiti and Oyo states respectively disagreed with the fact that plans are current and regularly updated. The aggregated data revealed that 84.7% disagreed that plans are current and regularly updated while 15.3% concede with the fact that plans are current and are regularly updated The chi-square test (Table 4.18) revealed that update on plan have no significant relationship with forest policy institutional framework support ( $\chi^2 = 0.367$ ,  $p > 0.05$ ).

### **4.8.3 Existence of current management plan**

Table 4.17 showed 100% of the respondents in Lagos, Ogun, Ondo, Osun and Oyo state disagreed with the fact that public forests have management plans while 18.9% in disagreed Ekiti disagreed. The aggregated data indicated that 96.9% disagreed that public forests have current management plan. The Chi-square test (Table 4.18) revealed that existence of current management plan have no significant relationship with forest policy institutional framework support ( $\chi^2 = 0.130$ ,  $p < 0.05$ )

#### **4.8.4 Check and Balances**

Table 4.17 showed that 54.5%, 42.9%, 45%, 28.6%, 18.2% and 18.2% of the respondents in Ekiti, Lagos, Ogun, Ondo, Osun and Oyo state respectively agreed that there are check and balances that prevent arbitrary changes in laws, policies and plans in the forest sector. The aggregated data indicated that 63.6% disagreed check and balances that prevent arbitrary changes in laws, policies and plans in the forest sector that 36.4% agreed. The Chi-square test (Table 4.18) revealed that existence of check and balances that prevent arbitrary changes in laws, policies and plans in the forest sector have significant relationship with forest policy institutional framework ( $\chi^2 = 3.506$ ,  $p > 0.05$ ).

#### **4.8.5 Support given to stakeholders in forest-related planning**

Table 4.17 showed 100% of the respondents in Ekiti, Lagos, Osun and Oyo state and 80% and 82.1% in Ogun and Ondo respectively disagreed that stakeholder are engaged, given space and supported in participating in forest-related planning. The aggregated data indicated that 93.7% disagreed that stakeholder are engaged, given space and supported in participating in forest-related planning while 6.3% agreed. The Chi-square test (Table 4.18) revealed that support given to stakeholders in forest-related planning have no significant relationship with forest policy institutional framework support ( $\chi^2 = 2.670$ ,  $p > 0.05$ ).

#### **4.8.6 Consideration for activities on private forestlands**

Table 4.17 showed 82.2%, 80%, 72.7%, 64.3% 57.1% in Oyo, Ogun, Osun, Ondo and Lagos states respectively of the respondents agreed with the fact that there is consideration for activities on private forestlands, while 72.7% of the respondents in Ekiti state disagreed. The aggregated data indicated 68.1% agreed that there is consideration for activities on private forestland while 31.9% of the respondents differ. The chi-square test (Table 4.18) showed that consideration for activities on private forestlands have no significant relationship with forest policy institutional framework support ( $\chi^2 = 0.109$ ,  $p > 0.05$ ).

#### **4.8.7 Mechanism for cross-sectorial forest-related policy and planning**

Table 4.17 showed all the respondents in Ekiti and Lagos state (100%) disagreed with the fact that there are mechanism within the government to address policy and issues that cut across

forest and other sectors while 94.1%, 90%, 81.8%, 67.9% of the respondents in Ekiti, Lagos, Oyo, Ogun and Osun states respectively also disagreed. The aggregated data indicated 88.97% disagreed with the fact that there are mechanisms within the government to address policy and issues that cut across forest and other sectors while 11.03% of the respondents agreed. The chi-square test (Table 4.18) revealed that mechanism within the government to address policy and issues that cut across forest and other sectors have no significant relationship with forest policy institutional framework support ( $\chi^2 = 2.428$ ,  $p > 0.05$ ).

#### **4.8.8 Recording and reporting management activities**

Tale 4.17 showed all the respondents in Lagos, Ogun, and Osun states (100%) agreed with the fact that record and report of management activities are executed while 94.1%, 72.7% and 67.9% of the respondents in Oyo, Ekiti and Ondo respectively also acceded to this fact. The aggregated data indicated 89.1% agreed that recording and reporting of management activities are executed while 10.9% of the respondents differ. The chi-square test (Table 4.18) showed that recording and reporting management activities have significant relationship with forest policy institutional framework support ( $\chi^2 = 18.059$ ,  $p < 0.05$ ).

#### **4.9.0 Decision-making in Forest Resources Management Southwestern Nigeria**

##### **4.9.1 Decision-making on forestry issues based on supply and demand information**

Table 4.19 showed all the respondents in Ekiti, Lagos and Osun states (100%) disagreed with the fact that the State Department of Forestry use supply and demand information in decision-making on forestry issues while 95%, 94.1% and 78.6% respondents in Ogun, Oyo and Ondo states disagreed. The pooled data for Southwestern Nigeria indicated that 95.4% disagreed that they use supply and demand information in decision-making on forestry issues while 4.6% agreed. The chi-square test (Table 4.20) revealed that the use of supply and information in decision-making on forestry issues have no significant relationship with forest policy institutional framework support ( $\chi^2 = 3.525$ ,  $p > 0.05$ ).

##### **4.9.2 Formal mechanism in influencing forest policy by affected people**

Table 4.19 showed that 100%, 81.1%, 71.4%, 67.9, 64.7 and 54.5% respondents in Ogun, Ekiti, Lagos, Ondo, Oyo and Osun state respectively agreed with the fact that there are formal mechanisms for stakeholders to influence it. The pooled data for Southwestern Nigeria revealed that 71.9% agreed with this assertion while 28.1 disagreed. The chi-square test (Table 4.20) revealed that formal mechanisms to influence forest policy have no significant relationship with institutional framework support for forest policy ( $\chi^2 = 1.277$ ,  $p > 0.05$ ).

##### **4.9.3 Consultations with stakeholders and feedbacks used in decision-making**

Table 4.19 showed that 100%, 90.9%, 82.3%, 81.8%, 71.4% and 67.9% of the respondents in Ogun, Osun, Oyo, Ekiti, Lagos and Ondo state respectively disagreed with the fact that consultations with stakeholders are made and feedback is used making decisions. The pooled data for Southwestern Nigeria indicated that 82.4% disagreed with the fact that consultations with stakeholders are made and feedback is used making decisions while 17.6% agreed. The chi-square test (Table 4.20) revealed that consultations with stakeholders are made and feedback is used making decisions have no significant relationship with forest policy institutional framework support ( $\chi^2 = 3.451$ ,  $p > 0.05$ )

#### **4.9.4 Support for stakeholders' participation in forest-related decision-making**

Table 4.19 showed that all the respondents in Lagos, Ogun and Osun states (100%) disagreed with the fact that the state support for stakeholders' participation in forest-related decision-making. 94.1%, 90.9% and 89.1% respondents in Oyo, Ekiti and Ondo states also consented to this fact. The pooled data for Southwestern Nigeria indicated that 95.7% disagreed with the fact that the state support for stakeholders' participation in forest-related decision-making, while 4.3% agreed. The chi-square test (Table 4.20) revealed that support for stakeholders participation have no significant relationship with forest policy institutional framework support ( $\chi^2 = 7.564$ ,  $p > 0.05$ ).

#### **4.9.5 Capacity in engaging stakeholders in making decision**

Table 4.19 revealed that 100%, 72.7%, 64.7%, 54.5%, 7.1% and 0% respondents in, Lagos, Osun, Oyo, Ekiti and Ogun states disagreed with the fact that the state has capacity in engaging stakeholders in making decision and implementation. The aggregated data indicated that 49.8% disagreed with the fact that while 50.2% agreed. The chi-square test (Table 4.20) revealed that the state has capacity in engaging stakeholders in making decision and implementation have no significant relationship with forest policy institutional framework support ( $\chi^2 = 0.390$ ,  $p > 0.05$ ).

#### **4.9.6 Opportunities for stakeholders to seek review**

Table 4.19 revealed that 90.9%, 85.7%, 70%, 57.1%, 54% and 52.9% respondents in Ekiti, Lagos, Ogun, Ondo, Osun and Oyo states agreed that there are opportunities for reconsideration of the views and opinion of the State Department of Forestry. The aggregated data indicated that 68.5% disagreed that there are opportunities for reconsideration of the views and opinion of the State Department of Forestry while 31.5% agreed. The chi-square test (Table 4.20) revealed that there are opportunities for reconsideration of the views and opinion of the state have no significant relationship with forest policy institutional framework support ( $\chi^2 = 1.351$ ,  $p > 0.05$ )

#### **4.10.0 Stakeholders' participation in Forest Resources Management Southwestern Nigeria**

##### **4.10.1 Stakeholders' Involvement in forest policy formulation**

Table 4.21 showed that 98.9%, 98.9%, 98.6%, 98.5%, 98.3% and 97.2% of the respondents in Ondo, Osun, Ekiti, Lagos, Oyo and Ogun state respectively disagreed with the fact that Stakeholders have the chance to engage in the formulation of forest policy. The aggregated data for Southwestern, Nigeria indicated that 98.5% disagreed with the fact that opportunity exist to contribute in forest policy and management plan while 1.5% agreed.

##### **4.10.2 Formal mechanism in influencing forest Policy**

Table 4.21 showed that 82.8%, 82.4%, 78.8%, 69.8% and 68.8% of the respondents in Ekiti, Osun, Lagos, Oyo and Ogun state respectively agreed with the fact that there are formal mechanisms to influence forest policy while 64.9% of the respondents in Ondo state disagreed. The pooled data for Southwestern, Nigeria indicated that 69.9% agreed with the fact that there are formal mechanisms to influence forest policy while 30.1% disagreed.

##### **4.10.3 Gender sensitivity in forestry decision making**

Table 4.21 showed that 97%, 93.2%, 83.5%, 77.4%, 76.7% and 50% of the respondents in Lagos, Ekiti, Osun, Ogun, Oyo and Ondo state respectively agreed with the fact that gender sensitivity in forestry decision-making exist. Southwestern Nigeria's aggregated data showed that 78.1 percent agreed with the fact that gender sensitivity occurs in decision-making in forestry, although 21.9 percent disagreed.

##### **4.10.4 Access to information on forestry by stakeholders**

Table 4.21 showed that 77.2%, 71.4%, 71.2%, 69.9%, 68.1% and 50% of the respondents in Lagos, Osun, Ekiti, Ogun, Ondo and Oyo state respectively disagreed with the fact that there was access to information on forestry by stakeholders. The pooled data for Southwestern, Nigeria indicated that 76.3% disagreed with the fact that there is access to Information on forestry by stakeholders while 28.7% agreed.

#### **4.10.5 Public Notice on forest Policies, Laws and Projects**

Table 4.21 showed that 95.5%, 89.7%, 89.3%, 83.5%, 77.3% and 71.3% of the respondents in Ekiti, Oyo, Ogun, Osun, Lagos and Ondo state respectively disagreed with the fact that the states give public notice of proposed forest issues and programmes. The aggregated data for Southwestern Nigeria indicated that 84.4% disagreed with the fact that stakeholders in the state give notice to the public on planned forestry matters and projects while 15.6% agreed.

#### **4.10.6 Access to Loan for Investment in Forest-based Businesses**

Table 4.21 showed that 94.6%, 91.8%, 89%, 88.8%, 87.9% and 72.3% of the respondents in Ondo, Osun, Ekiti, Lagos, Oyo and Ogun state respectively disagreed with the fact that access to loan exist for investment in the forest-based businesses. The aggregated data for Southwestern Nigeria indicated that 87.4% disagreed with the fact that that access to loan exists for investment in the forest-based businesses while 12.6% agreed.

#### **4.11.0 Stakeholders' perception on enforcement of forest law in Southwestern Nigeria**

##### **4.11.1 Adequacy of sanctions**

Table 4.22 showed that respondents in the Lagos state (100 percent) denied that forest crime penalties are proportionate to crime while 89.6%, 88.9%, 84.2%, 80 and 77.8% of the respondents in Ogun, Oyo, Ondo, Osun and Ekiti respectively also acceded to this fact. The aggregated data from Southwestern Nigeria indicated 86.7% agreed while 13.3% of the respondents disagreed.

##### **4.11.2 Adequacy of equipment**

Table 4.22 showed that all the respondents in Ekiti, Lagos and Oyo states (100%) disagreed with the fact that equipment for operations by forest officials is adequate while 90%, 89.6% and 89.5% of the respondents in Osun, Ogun and Ondo respectively also acceded to this fact. The pooled data from Southwestern Nigeria indicated 94.85% agreed that equipment for operations by forest officials is adequate while 5.15% of the respondents disagreed. The chi-square test (Table 4.23) showed that adequacy of equipment for forest operations have no significant relationship with the existence and adequacy of forest law ( $\chi^2 = 0.810$ ,  $p > 0.05$ ).

##### **4.11.3 Effective coverage of assigned land area**

Table 4.22 showed that all the respondents in Ekiti, Lagos, Osun, and Oyo states (100%) disagreed with the fact that there is effective coverage of the assigned land area while 89.5% and 82.8% of the respondents in Ondo and Ogun state respectively also acceded to this fact. The pooled data from Southwestern Nigeria indicated 95.4% agreed that while 4.6% of the respondents differed. The chi-square test (Table 4.23) showed that effective coverage of assigned land area have no significant relationship with the existence and adequacy of forest law ( $\chi^2 = 0.613$ ,  $p > 0.05$ )

#### **4.11.4 Adequacy of staff for effective coverage of land area**

Table 4.23 showed that all the respondents in Lagos, Ogun, and Osun states (100%) disagreed with the fact that staffs were adequate for effective coverage of land area within the forest reserve while 94.1%, 72.7% and 67.9% of the respondents in Oyo, Ekiti and Ondo respectively also acceded to this fact. The pooled data from Southwestern Nigeria indicated 92.8% differed, that staff was adequate for effective coverage of land area within the forest reserve while 7.2% of the respondents disagreed. The chi-square test (Table 4.23) showed that adequacy of staff for effective coverage of the land area have no significant relationship with the existence and adequacy of forest law ( $\chi^2 = 1.018, p > 0.05$ ).

#### **4.11.5 Forest crime prevention**

Table 4.23 showed that all the respondents in Ekiti and Oyo states (100%) disagreed with the fact that there are effective measures for forest crime prevention while 84.2%, 80%, 79.3% and 60% of the respondents in Ondo, Lagos, Ogun and Osun respectively also acceded to this fact. The pooled data from Southwestern Nigeria indicated 83.9% differed, that there were effective measures for forest crime prevention while 16.1% of the respondents agreed. The chi-square test (Table 4.23) revealed that forest crime prevention have no significant relationship with the existence and adequacy of forest law ( $\chi^2 = 1.354, p > 0.05$ ).

#### **4.11.6 Forest crime detection**

Table 4.23 showed that all the respondents in Ekiti, Lagos, and Oyo states (100%) disagreed with the fact that there were effective measures for forest crime detection while 84.2%, 80% and 79.3% of the respondents in Ondo, Osun and Ogun respectively also acceded to this fact. The pooled data from Southwestern Nigeria indicated 90.6% disagreed there were effective forest crime detection while 9.4% of the respondents agreed. The chi-square test (Table 4.23) revealed that effective measures for forest crime detection have no significant relationship with the existence and adequacy of forest law ( $\chi^2 = 0.053, p > 0.05$ ).

#### **4.11.7 Forest crime suppression**

Table 4.23 showed that all the respondents in Ekiti, Lagos, and Ondo states (100%) disagreed with the fact that there were effective measures for forest crime suppression while 80%, 79.3% and 66.7% of the respondents in Osun, Ogun and Oyo respectively agreed to the fact there is forest crime suppression. The pooled data from Southwestern Nigeria indicated 62.3% disagreed that there is forest crime suppression while 37.7% of the respondents agreed. The chi-square test (Table 4.23) showed that effective measures for forest crime suppression have no significant relationship with the existence and adequacy of forest law ( $\chi^2 = 4.006$ ,  $p > 0.05$ ).

#### **4.11.8 Investigation of serious forest crimes**

Table 4.23 showed that all the respondents in Ekiti and Oyo states (100%) disagreed with the fact that there were investigation of serious forest crimes while 68.4%, 60%, 60% and 58.6% of the respondents in Ondo, Lagos, Osun Ogun state respectively also acceded to this fact. that there is investigation of serious forest crimes The pooled data from Southwestern Nigeria indicated 68.3% disagreed that while 31.7% of the respondents agreed. The chi-square test (Table 4.23) showed that investigation of serious forest crimes have no significant relationship with the existence and adequacy of forest law ( $\chi^2 = 0.067$ ,  $p > 0.05$ ).

#### **4.11.9 Extent of coverage against forest crimes**

Table 4.23 showed that all respondents in the state of Lagos (100 percent) disagreed with the degree to which efforts against forest crime involved transportation, processing and trade. while 89.5%, 60%, 60%, 55.6% and 51.7% of the respondents in Ondo, Osun, Lagos, Ekiti and Ogun state respectively also acceded to this fact. Southwestern Nigeria's pooled data showed that 66.1 percent disagreed that transport, manufacturing and exchange covered the extent of the campaign against forest violence, while 33.9% of participants disagreed. The chi-square test (Table 4.23) showed that the spectrum of forest crime coverage has no substantial connection with the nature and adequacy of forest law. ( $\chi^2 = 2.952$ ,  $p > 0.05$ )

**Table 4.22: Stakeholders' perception on enforcement of forest law in Southwestern Nigeria**

#### 4.12.0 Logistic regression analysis of factors negating good forest governance in Southwestern, Nigeria

Factors investigated were Lack of accountability (*LACC*), Ineffectiveness (*IEFV*), Inefficiency (*IEFC*), Lack of respect for the rule of law (*LRRL*), Lack of participation (*LPAT*) and Lack of transparency (*LTRC*)

##### 4.12.1 Ekiti State

$$GFG_{(Ekiti)} = 2.89 - 37.75LACC - 4.41IEFV - 2.40IEFC - 36.50LRRL - 2.40LPAT + 8.21LTRC \dots\dots \dots \text{Equation 3}$$

n = 56, Final loss = 5.73, Chi square (df, = 6) = 57.33, p = 0.00

Odd ratio (Unit change): Constant (2.89); *LACC* (0.00); *IEFV* (0.01); *IEFC* (0.09); *LRRL* (0.00); *LPAT* (0.09); *LTRC* (3667.4)

Lack of transparency (*LTRA*) was the only odd-ratio of 3667.4

Where,

*GFG*= Good Forest Governance

*LACC* = Lack of accountability

*IEFV* = Ineffectiveness

*IEFC* = Inefficiency

*LRRL* = Lack of respect for the rule of law

*LPAT* = Lack of participation

*LTRC* = Lack of transparency

**Table 4.24: Logistic binary nature of Good forest governance in Ekiti State**

| <b>Dependent variable (GFG): Good Forest Governance (Present = 1; Absent = 0)</b> |                    |                   |

| Model $\chi^2$ (df = 6) = 383.07*   |                    |                   |

\* = significant at p < 0.05

#### **4.13.1 Implementation of Procurement Rules**

Table 4.31 revealed, 100% of the respondents in Lagos, Ogun, Osun and Oyo state and 97.8% and 76.7% in Ondo and Ekiti respectively disagreed that procurement rules have been effectively implemented. The pooled data in Southwestern Nigeria indicated that 95.8% disagreed that procurement rules have been effectively implemented while 3.3% agreed and 0.9% were passive. Further test (Table 4.32) revealed, procurement rule have no significant relationship with transparent, corrupt free process on concession and sales ( $\chi^2 = 2.921, p > 0.05$ ).

#### **4.13.2 Opportunity to Report Corrupt Practices is Effective**

Table 4.31 showed that 100% of the respondents in Lagos, Ogun, Ondo, and Osun state and 97.7% and 93.3% in Ondo and Ekiti respectively disagreed that there is opportunity to report corrupt practices are effective. The pooled data in Southwestern Nigeria indicated that 95.8% disagreed while 1.1% agreed and 0.4% non response. The chi-square test (Table 4.32) showed that opportunity to report corrupt practices have no significant relationship with transparent, corrupt free process on concession and sales ( $\chi^2 = 1.245, p > 0.05$ ).

#### **4.13.3 Systems Resistant to Corruption**

Table 4.31 showed that 100% of the respondents in Ogun, Osun and Oyo state and 96.7% in Ekiti and Lagos state while 95.6% in Ondo state disagreed that systems re resistant to corruption. The pooled data in Southwestern Nigeria indicated that 99.4% disagreed while 0.4% agreed and 0.2% non response. The chi-square test (Table 4.32) showed that system are resistant to corruption, have no significant relationship with transparent, corrupt free process on concession and sales ( $\chi^2 = 3.671, p > 0.05$ )

#### **4.14.1 Challenges of saw-millers in Southwestern, Nigeria**

Table 4.33 showed the response of saw-millers on the array of challenges they face in Southwestern, Nigeria: power failure (19.7%), high cost of machines/replacement (13.8%), scarcity of wood (11.8%), expensive spare parts (8.6%), High cost of fuel and maintenance (7.2%), finance (4.6%), unfavourable government policy (4.6%), environmental pollution (4.6%), closure of government forest during raining season (4.6%), scarcity of labour (4.6%) obsolete machines (3.3%) and lack of access to loan (2.6%).

#### **4.14.2 Challenges of timber contractors in Southwestern, Nigeria**

Table 4.34 showed the response of timber contractors on the challenges they face in Southwestern, Nigeria: scarcity of choice timber species/closure of the forest during raining season (52.4%), High cost of transportation/difficulty in accessing the forest in raining season/high cost of transportation (12.2%), illegal activities in the forest (15.9%), high cost of machines/replacement (13.8%), finance (8.5%), (4.6%), incessant tariff increment/multiple way-billing (4.9%), Indian Hemp planters/poachers (4.9%), loss of logs on water-ways (1.2%).

#### **4.14.3 Challenges of plank dealers in Southwestern, Nigeria**

Table 4.35 showed the response of plank dealers on the challenges they face in Southwestern, Nigeria: lack of funds (17.3%), scarcity of choice timber species (14.5%), poor infrastructure (11.8%) multiple way billing (7.3%) high cost of transportation (7.3%), difficulty in accessing the forest during raining season (6.4%), poor sales (5.5%) insecurity (5.5%), exploitation by timber contractor (4.5%) environmental pollution (4.5%) closure of government forest during raining season (3.6%), bad road (3.6%), high cost of timber (2.7%), debt of customers (2.7%) , seizure of hammer (0.9%), lack of access to loan (0.9%), arbitrary change in tariff (0.9%).

#### **4.14.4 Challenges of private forest plantation owners in Southwestern, Nigeria**

Table 4.36 showed the response of private forest plantation owners on the challenges they face in Southwestern, Nigeria: lack of funds (97.5%), seedling/seed procurement (80%), high cost of land (60%) no assistance from the government (30%), land tenure issues (47.5%), fire outbreak (35%), illegal logging (30%), low pricing (27.5%), lack of technical skills (20%) and urbanization (20%).

**Table 4.33: Distribution of saw-millers on their challenges**

| <b>Challenges</b>                           | <b>Frequency</b> | <b>Percentage</b> |

SM – Saw millers

TC- Timber contractors

PD – Plank dealers

#### **4.16.0 Logistic regression analysis of stakeholders' willingness to establish forest plantation in Southwestern, Nigeria**

To investigate incentives which could influence stakeholders' (saw millers, timber contractors and plank dealers) willingness to establish forest plantation (*WTEFP*), logistic regression analysis was used. The incentives were: Training (*TRNG*), Provision of Seedlings (*PSDLNS*), Provision of Fast Growing Species (*PFGS*) and Favourable Government Policy (*FGP*).

**4.16.1 Saw millers**

$$WTEFP_{(saw\ millers)} = 15 + 10.98TRNG - 2.70PSDLNS + 10.98PFGS - 70.78FGP \dots \dots \text{Equation 10}$$

n = 145, Final loss = 0.00, Chi square (df, = 4) = 186.81, p = 0.00

Odd ratio (Unit change): Constant (3876081); *TRNG* (58864.95); *PSDLNS* (0.07); *PFGS* (58864.95); *FGP* (0.00)

Training (*TRNG*) Provision of Fast Growing Species (*PFGS*) had the same odd-ratio of 58864.95 (Table 4.38).

**Table 4.38: Logistic binary nature of saw millers’ willingness to establish forest plantation in Southwestern Nigeria**

| <b>Dependent variable (<i>WTEFP</i>): Willingness of saw millers to establish forest plantation (Present = 1; Absent = 0)</b> |                    |                   |
|---|--------------------|-------------------|
| <b>Independent variables</b>  | <b>Coefficient</b> | <b>Odds-ratio</b> |
| If <i>TRNG</i> is present to ensure forest plantation establishment   | 10.98              | 58864.95*         |

| Model $\chi^2$ (df = 4) = 408.35*   |                    |                   |

\* = significant at p < 0.05

## CHAPTER FIVE

### DISCUSSION

#### 5.1 Demographic information

Male gender is in the majority both among the forestry officials and other stakeholders (saw-millers, timber contractors, plank dealers, private forest plantation owners and farmers). This does not necessarily make forestry the exclusive preserve of men. Forestry jobs are laborious, remote and risky. For these reasons, choice of forestry jobs and businesses is skewed to men. Women in forestry most times are perceived as brave and adventurous and in some extreme cases are seen as men, since when duty calls they will be expected to brace up and meet these conditions. This therefore implied that forest governance in Southwestern Nigeria, is male dominated. This is corroborated by USAID (2013) that from local to international level, the absence of equal numbers of men and women, regardless of stakeholder group, have been noted. Women from indigenous and other forest-dependent communities are particularly underrepresented and also by Sunderland and Achdiawan (2014) referred to the fact that, with strong disparities across tropical Asia, Africa, and Latin America, men play a much more important and diverse role in the contribution of forest products to rural livelihoods than previously recorded.

The numbers of respondent across the age classes consistently rose until it hits the peak and begun to fall. That is, it rose from new entrant, lower middle age, upper middle age, and then began to decline at advanced age class and further declined at the more advanced age class. The availability of active work force implied capable hands for forest governance which ideally

should culminate to sustainable forest management in Southwestern Nigeria, all things been equal. This is in agreement with Nzeh *et al.* (2010) with emphasis on the fact that forest products provide employment more for able-bodied men than the younger and older men. The reason for both the younger men and older men not having higher employment from forest product may be connected to lots of energies required to handle these products, especially forest wood products.

Most respondents had primary and secondary education. This is clearly expressed by the fact that this is the level of education available within most rural areas. This indicated that they only sort for education within their vicinity (Plates 5.1 and 5.2) considering the attendant difficulty inherent in furthering their education elsewhere. More than ten percent of the respondents had no formal education. The essence of higher education is the acquisition of higher level of enlightenment which enhances productivity and better sense of judgment. This in no small measure should advance the course of good forest governance. The implication of most respondents having primary and secondary education is remaining at the crude subsistence level and poor forest governance. This agrees with UNESCO (2000), which stated that “educational access is more difficult in rural areas, as there are fewer schools and fewer resources, in addition to the tradition that rural children are often kept from attending school to help with agricultural or house chores”.

**Plate 5.1: School Children in Aworo Primary School, Ogun State**

**Plate 5.2: A village School in Aworo Village, Ogun State.**

## **5.2. Technical and professional staff deficit in selected Forest Reserves in Southwestern, Nigeria**

The estimated requirements represent the minimum number of staff of each category that should be available to cater for the management of the forest reserves. All the forest reserves had a serious deficiency with respect to technical staff while most of the forest reserves are also deficient of professional staff with exception to Ogbese, Ikere and Ogun river forest reserves. This implies that adequate technical and professional staff is not on ground to execute the mandate of state departments of forestry with respect to forest reserves in Southwestern Nigeria. This agrees with the study of Enabor (1981) that Ogun, Benue and Borno states experienced serious shortages of staff in forestry which will be aggravated by the planned intensification of forest management during 1981 – 1985. This is corroborated by Bettinger *et al.* (2009) who observed that “there is an acute shortage of manpower in the forestry sector in many developing countries”.

### **5.3.1 Extent of forest cover in forest reserves in Southwestern, Nigeria from 1987 to 2017**

The aim of this study was to gain quantitative understanding of the size of the forest reserves over a thirty-year period (1987 – 2017) in selected forest reserves in Southwestern, Nigeria. The thirty-year period was classed from 1987, 1997, 2007 and 2017. The study area has been defined to have three forest cover types, which were built up / bare surface, shrub and forest areas. In Ogun River Forest Reserve which is situated in Lagos State, built up and shrub (non-forest vegetation) consistently increased while forest area consistently decreased over the period. This was attributed to massive deforestation activities over the years. According to the study, this forest reserve as at 2017 was only about 5.24km<sup>2</sup> (33.91% of the initial forest). The forest cover is fragile due to deforestation, degradation, illegal felling, encroachment, etc. as narrated by Giri *et al.* (2003) and Bolland *et al.* (2007) that “underlying causes of deforestation include rapid economic development, population growth and poverty”.

Increase in non-forest vegetation is due to ever increasing number of people involvement in agriculture year in year out. Over this period of time, the influxes of people and increased commercial activity into Lagos State have undoubtedly made the State the commercial nerve centre of Nigeria. This development, however, also came with massive deforestation and de-

reservation of the existing forest reserves. Ogbese Forest Reserve in Ekiti, had consistent increase in built up areas with 2007 as the only exception, same goes with shrub areas while in forest area, the forest size diminished consistently with an exceptional case of increase in 2007. Most forest reserves (Aworo, Olokemeji, Oluwa, Akure, Ago-Owu, Onigambari and Osho) had consistent rise in built up area, this indicating increased human settlement and economic activities while increase in non-forest vegetation and decline in the sizes of the forest in the reserves were also observed over the period of study. The implication of this therefore is that all (without exception) these forest reserves had been encroached upon and unabated deforestation which is in variance with good forest governance was evident. Similarly, other researchers have revealed that the expansion of agricultural land has been at the expense of lands with natural vegetation cover (Amsalu *et al.*, 2006; Woldeamlak (2002), Schneider and Pontius (2001).

### **5.3.2 Forest cover change in selected forest reserves in Southwestern Nigeria from 1987 to 2017**

Forest cover change in the forest cover and percentage change in Ogun River, Ogbese, Aworo, Olokemeji, Oluwa, Akure, Shasha, Ago-Owu, Onigambari and Osho reflected negative change in the thirty-year period with only Ikere forest reserve with positive change under the same period. This implied that the rate of afforestation is lower than deforestation. This portends danger to posterity and contrary to everything sustainable forest management stands for. Brandy (1994) has observed that, continuous trend forest exploitation will result in diminishing the remaining tropical forest by the end of the 21st century.

### **5.3.3 Rate of deforestation in selected forest reserves in Southwestern Nigeria from 1987 to 2017**

Rate of deforestation in Ogun River, Ogbese, Ikere, Aworo, Olokemeji, Oluwa, Akure, Shasha, Ago-Owu, Onigambari and Osho forest reserves indicated a trend of deficit in forest cover within the thirty-year period with exception to Ikere forest reserve in Ekiti State between 1987 and 1997. This implied that there was more deforestation than reforestation in the remaining forest reserves which is in variance with sustainable forest management and good forest governance. This assertion is corroborated by Kalu *et al.* (2014), who affirmed that “forest

exploitation has always been on geometric trend in most parts of Nigeria and has not been ever matched by afforestation efforts to enhance sustainable afforestation and tree planting programme in Nigeria. This was also emphasized by Akinbowale *et al.* (2019), who stated that nobody can dispute the fact that the rate of deforestation is far higher than that of tree planting, in the light of these circumstances, there is need to plant more trees in Nigeria.

#### **5.4.1 Existence of forest policy on sustainable forest management in Southwestern, Nigeria.**

The study shows that all the States (Ekiti, Lagos, Ogun, Ondo, Osun and Oyo) in the study area indicated the existence of forest policy elements on sustainable forest management. The existence of forest policy on sustainable forest management indicates political will to manage forests efficiently. Without the existence of forest policy on sustainable forest management, Southwestern, Nigeria is not likely going to conserve her forest resources. According to Kishor *et al.* (2012), enforcing forest law due to the existence of policy on sustainable forestry might not be guaranteed but fortunately, commitment by its handlers is created that cannot be easily reversed and also, when interpretation of the law is necessitated the courts will look at policy declarations.

#### **5.4.2 Level of implementation of forest policy on sustainable forest management in Southwestern, Nigeria.**

Existence of forest policy is one thing; implementation of the policy is another. The study probed into the level of implementation of the existing policy on sustainable forest management. The thematic elements of sustainable forest management were considered. They include afforestation and reforestation project, forest health and vitality, productive functions (through funding and silvicultural practices), protective or environmental functions, socio-economic functions of forest to sustainable livelihoods of forest dependent communities/general public and institutional framework support provided by the states. In all the ratings, in the last ten, five and two years, all fell below fifty percent level of implementation on the average. This left a lot to be desired, which simply implied, if this observed trend continues, sustainable forest management will be very difficult to accomplish in southwestern, Nigeria. This is corroborated by Famuyide and Adebayo (1993) that “there are many hindrances to effective implementation of the forest policy

in Nigeria which includes; resource allocation, revenue generation, forestry practices and land use, policy environment and policy enunciation”.

### **5.5.1 Existence of planning**

Most respondents in the study area are of the opinion that all the states considered planning very important. The fact that planning is perceived to exist in all the States implied that the States considered the long-term future of the forest, since forest management plans look futuristic in its approach, without which ensuring sustainability is most unlikely. Planning is the foundation upon which forest management is built. However, planning is not an end in itself but a means to an end (forest policy implementation). Forest management planning ensures that forestry operations and related activities are carried out in ways that support the sustainable management of all forest resources for generations to come. US Forest Service (2012) affirms forest planning sets the overall management direction and guidance for the entire forest and the foundation of every decision made on the forest.

### **5.5.2 Updating of plans**

It is not enough that plans exist, it is equally important for plans to be reviewed and revised regularly. Is one thing that plans exist to cater for the effective management of forest resources, it is another to review and revise the plans from time to time in other to cater for the present realities. If plans are rigid, it is a reflection that forest use, forest conditions and knowledge acquired over-time in managing the forest is static, which usually is not always the case. A lot of experience is acquired overtime in the practice of forest management and it is expected these experiences should better the lot of posterity. A good number of respondents disagreed with the fact that plans are updated in all the States. This implied that despite the fact, it is in the policy of the states to plan for forest management, regular updates of such plans are not made. This puts the entire system in a sort of “straight jacket” operation which lack dynamism; where lessons from previous mistakes and shortcomings become very difficult to be impacted on future operations due to the stereotype nature of management and could be a serious breach on sustainability of the forest.

### **5.5.3 Existence of current management plan**

Ideally, the State forestry service should prepare current management plans otherwise known as working plan on the basis of long-term and short-term. Management plans refers to plans that deal with management operation and projects impacts over an appreciable length of time. Majority of the respondents in Southwestern, Nigeria opined that management plan does not exist. This implied that the management runs the forest on obsolete management plan. This de-emphasizes it, as a useful document for evaluating the present status of forests, past management and its impacts, and the prescriptions for future management interventions (NWPC, 2014).

### **5.5.4 Check and balances in forest policy**

It is important that check and balances exist; this discourages rapid and arbitrary change in forest policy. Where there are rapid and arbitrary changes, forest resources management cannot be said to have policy or any sense of direction. Most respondents disagreed that check and balance which discourage rapid and arbitrary change in forest policy exist. This implied that some degree of predictability and stability cannot be achieved thereby giving room for corruption to thrive in the governance of forests in Southwestern, Nigeria. This negates Kishor *et al.* (2002). He was of the view that change is not bad in itself. Rather, after a thorough examination of the consequences, transition should not be subjective. A legislative act, taken after consultation or hearings and consideration of alternatives, should be viewed as a premeditative measure.

### **5.5.5 Support to stakeholders for active engagement in Forest-related Planning**

Most respondents in Southwestern Nigeria, disagreed that stakeholders are engaged, given opportunity and allowed in participating in forest-related planning. This implied that forest governance is a state affair in Southwestern, Nigeria. It further explains the reason for myriads of challenges been faced and why massive destruction of forest is the order of the day and so much difficulty in cubing illegality in all of its forms.

### **5.5.6 Consideration for Private Forestlands**

The role of government is to provide enabling environment for the private sector to thrive. Entrusting some specified functions to none government stakeholders allows the government to focus more on administrative matters. Most respondents agreed that there is consideration for activities on private forestland. This consideration though is limited to registration with the State, technical assistance and tariff paid during logging. Verbal enquiry revealed that all the State Departments of Forestry in the study area do not consider the private sector to function in the activities traditionally perceived to be the preserve of the Forest Department. This also buttresses the fact that forest governance in this region is a State affair. This agrees with Akinbowale *et al.* (2019), who stated that most of the private sector involvement in plantation establishment has been limited to individuals and schools as a result of inaction of the government towards private forest establishment.

### **5.5.7 Mechanism across forest related policy and planning**

Forestry issues, tend to cut across different sectors. As long as other sectors exist, there will always be a need for cross-sectorial forest-related policy and planning. Most of the respondents disagreed with the fact that there are mechanisms within the government to address forestry issues that cut across other sectors. This implied that other forest-related sectors that are concerned with forest products and/or services are not involved in the policy and planning. This is the bane of forestry in Southwestern Nigeria. Forestry is too broad and inter-related to life than to be isolated. It is the isolation of forestry from these other entire sectors that confined forestry to its present state today. If from the inception of forestry practice in Nigeria, the entire related sectors are involved in forest-related policy and planning, the holistic nature of forestry would have been better appreciated and contribution from these sectors would have moved forestry way ahead of its present state. This negates Gregersen *et al.* (2004), which state that "cross-sectorial linkages and impacts are important in shaping forest governance approaches in most countries." Sectors such as the judiciary, agriculture, electricity, transport, environment, help each shape the approach of each country's approach to forest conservation, management and use".

### **5.5.8 Recording and Reporting Management activities**

A way to check whether strategies are consistently followed involves good management. That implies that to fulfill its plans, the Forestry Department should keep a record of its operations. Records should be kept open for public inspection in order to stay accountable. Someone who reviews the records should be able to confidently determine what actions have been taken and whether management plans have been followed. It is document retention and efficient reporting that will reveal this. Most respondent agreed that recording and reporting of management activities are carried out. This implied it is verifiable if plans are being followed or otherwise and as a result enhancing effectiveness. This agrees with Gregersen *et al.* (2004) who stated that, if there are reporting mechanisms that are straightforward and readily understood by all, governance is likely to be more efficient, thereby increasing the need for transparency.

#### **5.6.1 Supply and demand information**

Most of the respondents disagreed with the fact that forest-related decisions are made using supply and demand information in State Department of Forestry. The implication of this is that markets for forest products are not studied so that market forces can determine forest product pricing. This introduces high level of arbitrariness in forest product pricing and as such forest product pricing are undervalued as this has always been the case. This is in agreement with Abu (2003), that the relatively low price paid for timber export goes to support the view that although forest products had at one time been on top as the nation's foreign exchange earner, its contribution to the nation's income was much lower than it would have been due to improper pricing in which no consideration was given to the cost of renewal and possible replacement.

#### **5.6.2 Formal mechanism to influence decision**

Most respondents agreed that formal mechanism by the State Department of Forestry to influence their decision by other stakeholders exist. This implied that stakeholders do formally lodge complaints on issues affecting them from time to time, thereby being able to alter afore-made decision of the forestry department. Moreover a participatory approach – involving stakeholder's decision-making process is a way to increase social sustainability and an important tool to support sustainable forest management (Kangas *et al.*, 2006 and De Meo *et al.*, 2011).

### **5.6.3 Consultation with stakeholders and feedback used in decision making**

Majority of respondents disagreed with the fact that stakeholder meetings are held and feedback is used for decision-making. Consultation in this regard with stakeholders is quite minimal; reasons being that capacity is abysmally low coupled with fact that engagement with stakeholders is more often than not tariff related. Whereas, every policy is driven by stakeholders, hence their contribution is of immense value.

### **5.6.4 Support for stakeholder's participation in decision-making**

Most respondents disagreed with the fact that the State Department of Forestry engages other stakeholders and give room for participation of forest-dependent communities in decision making is supported. Lack of support for stakeholders' participation in decision making may be an indicator to lack of respect for the rule of law evident in illegal logging.

### **5.6.5 Capacity to engage stakeholders in decision-making processes**

Some respondents are of the opinion that the State does not have the capacity to engage stakeholders. This may be the cause for state centric forest governance. Building capacity to facilitate and strengthen the involvement of different stakeholders is an integral part of many forest policy development processes; for example, in Latvia, Serbia, Turkey and Uzbekistan, all working group members were trained to use a participatory approach to policy development from the onset.

### **5.6.6 Avenue for stakeholders in seeking review on decision**

Most of the respondents disagreed with the fact that avenues for stakeholders in seeking review on decisions are practical and effective. Pockets of cases, where stakeholders seek review or reconsideration on decision exist but the point here is they are not seen as practical enough and as such they cannot be effective. Command-and-control measures alone have also been found to be ineffective in the management of valuable protected areas.

### **5.7.1 Involvement in creating forest policy and forest management plan**

Most respondents disagreed with the fact that stakeholders have opportunity to be involved in creating forest policy, forest management plan or on any practical action taken to encourage involvement in this regards. The implication of this is participation of other stakeholders is thus restricted limited to forestry departments in the States. Throughout the process, involvement of key stakeholders at national and State levels is key, this results to mutual ownership of the resulting policy and shared responsibility for the implementation of the policy. In the protection of valuable protected areas, command-and-control measures alone have also been found to be ineffective.

### **5.7.2 Existence of formal mechanism in influencing forest Policy**

Most respondents in all the States with the exception of Ondo State agreed with the fact that there are formal mechanisms to influence forest policy while majority disagreed with this assertion in Ondo state. Though, stakeholders have limited the scope of influencing government policy to tariff increment related issues. They are less concerned with other salient issues which have to do with ensuring sustainability of the forest products and the environment. They seem to only leverage the opportunity of dialoguing with the State on personal aggrandizement. Ondo State denial of the existence of such mechanism could be attributed to the fact that most of government policies have always remained the same over the years with little or no change irrespective of public complaints.

### **5.7.3 Gender sensitivity in participation in forestry decision-making processes**

Most respondents in all the States agreed that decision-making processes in forestry are gender sensitive. Gender equity is of paramount importance more so in forestry but if there is no voice, how can one be heard. There seem not to be discrimination against women. It is equally important that women organize themselves and make deliberate efforts in participating in forestry at all levels. This will enable them to be a voice that could ensure fair hearing.

#### **5.7.4 Access to information**

Most respondents disagreed with the fact that access to information on forestry by stakeholders exist. If the stakeholders are oblivious of happenings in State Department of Forestry, it implied they have been edged out of participating in forest management in Southwestern, Nigeria. For there to be information sharing in the first place, it must exist. In some cases it is obvious this information is out rightly unavailable and when available, some of the information has been classified and when they are not classified, the bureaucratic procedures involved are breath taking. The researcher had his fair share in the course of this study. In order to engage stakeholders significantly, sound and accurate information and data on a variety of subjects are required.

#### **5.7.5 Public notice on forest policies, laws and projects**

The vast majority disagreed with the fact that the States give public notice on forestry matters. Ideally, it is the responsibility of the State to give periodic notices to the public on forestry matters. When stakeholders are denied the opportunity to contribute in making decisions that ultimately determine their well being, it is a clear evidence of failure in forest governance. Public notice serves as one of the 3 E's in forestry (enlightenment, engineering and enforcement). It is one thing the government should do to give the masses the required enlightenment needed to ensure understanding and robust contribution in forestry issues. There are several ways to connect and collaborate with stakeholders and the general public, including the internet, mobile telephone, radio, commercial or State television, village assemblies, town hall meetings and theatre. Experience shows that communication systems at the community level are the most effective for reaching local people.

#### **5.7.6 Loan**

Most respondents disagreed with the fact that there are loan facilities specifically for forestry investors. Most lenders would rather invest their money on ventures that could give a high turnover at the earliest possible period. Considering the environmental benefits of forestry especially in plantation establishment, it is expected that funds be made available in terms of loans on a single digit interest rate. The reason for limited number of investors in forestry is

likely associated with inadequate access to loan. This was corroborated by Castren *et al.* (2014) who stated that forestry businesses, except those interested in short-term returns irrespective of sustainability concern, have extreme difficulties raising finance.

### **5.8.1 Adequacy of Sanctions**

Most of the respondents disagreed with the fact that sanctions imposed on offences are adequate. That is penalties for forest offences are not commensurate to these offences. Further enquiry revealed penalties such as arrest, detainment and payment of fines. Imprisonment for offences is rare; most of the penalties have been compounded (monetized). The reason for sanctions is to deter would-be offenders but if rather, it encourages offenders then it becomes counterproductive.

### **5.8.2 Adequacy of equipment**

Forest equipment in executing forest operations ranges from wears (overall, belts, helmet, boot e.t.c) for covering and protection, to arms for defense and attack, to simple tools such as cutlass, whistle, binoculars, compass, walkie-talkie to the more sophisticated ones such as vehicle and helicopter. For a successful forest law implementation, skillful manpower, funds as at when needed and adequacy of equipment are indispensable. The vast majority of the respondents disagreed with the fact that equipment for forest operations was adequate in the study area. This is in line with Popoola (2011), who stated that, in sub-Saharan Africa, many governments lack the national capacity to monitor illegal logging. Patrol cars, security and communications facilities are missing in many cases. This often puts poorly trained and ill-equipped forestry workers at risk against the often more advanced illegal loggers.” This explains the wanton deforestation and degradation of forests in such an alarming rate with little or no offenders to show for it. The fact still remains that offenders are humans and not spirits. All things being equal offenders are to be arrested and brought to book. If this were to be so, would-be offenders would be deterred.

### **5.8.3 Coverage of assigned land area**

Protection of the forest reserve entails assigning areas of the reserves to staff that will be responsible for its protection. Most respondents disagreed with the fact that there is effective coverage of the assigned land area. This implied that the respondents considered the assigned land areas too large for effective coverage by the assigned staff.

### **5.8.4 Adequacy of staff for effective coverage**

Most of the respondents disagreed with the fact that staff are adequate for effective coverage of the assigned land area within the forest reserve. The embargo on employment in the States occasioned by insufficient funds to pay workers salaries has gone a long way to reduce the manpower ratio in the study area. With this development, staff are demoralized in executing their function knowing the fact that they are expected to do much more than what they should. A demoralized staff will do far less than is been expected. This is the bane of forest reserve in Southernwestern, Nigeria. According to FAO (2003) there is shortage of manpower, in State Departments of Forestry in Nigeria, most of who lack adequate training and exposure to modern forestry techniques.

### **5.8.5 Effective measures for crime prevention**

One key measure against forest crime is prevention. Prevention is better than cure, it is said. If so much is put into crime prevention, little will be left to be done but if little or nothing is done, fighting of forest crime could be a herculean task. Most respondents disagreed with the fact that there are effective measures for forest crime prevention. Virtually all the strategies that are needed to be in place as effective measures for crime prevention are lacking. Popoola (2011) has argued that the forestry sector is rife with vulnerability. State forestry authorities are almost exclusively concentrated on revenue collection and basically do not practice forest management. Owing to wide-spread corruption, regulation is almost non-existent or totally ineffective. Hence forest crime seems inevitable.

### **5.8.6 Effective measures for crime detection**

Most of the respondents disagreed with the fact that there is forest crime detection. This agrees with Popoola (2011) posited that failure to comply with rules and regulations is often either not detected or the requisite corrective steps and punishments are either not imposed or prevented by corruption if detected. The implication of undetected crime is unabated crime. Early detection of forest crime and appropriate sanction will go a long way to checkmate crime.

### **5.8.7 Effective measures for crime suppression**

Most of the respondents disagreed that there are effective measures for forest crime suppression. Though there are cases of arrest, fines and detention of offenders, seizure of timber felled illegally have also been presented as exhibit. The point here is, there are much more offenders who escape than those who are arrested. World Bank (2006), gave credence to this fact by asserting that, suppression of forest crime in developing countries is very limited and essentially ineffectual, providing very little deterrence to further crimes. Akella *et al.* (2004) disaggregate the deterrent effect into low probabilities of crime detection, prosecution, and conviction and, similarly, low expected sanctions and penalties. In sum, few forest crimes are prosecuted, and few offenders are punished.

### **5.8.8 Regular investigation of serious forest crimes**

Higher percentage of the respondents disagreed that serious forest crimes are investigated. That is, regular investigations of serious forest crimes are not carried out. The implication of this is unabated crime. Offenders become embolden in all manner of offence being fully persuaded they will not be uncovered. According to World Bank (2006), forestry in many countries is in many ways excessively steeped in a para-military and policing mindset and the paraphernalia of uniforms, arms, and hierarchy. Even where these traditions have weakened, all modern forestry sectors are marked with more or less formal procedures, guidelines, and standards to guide routine operations of investigation, remedies, and sanctions that are evoked by deviations and abuse.

### **5.8.9 Extent of coverage against Forest Crime**

Majority disagreed with the fact that extent of effort against forest crime covered transport, processing and trade are effective. Checkpoints staffed by forest authorities have been reported to be ineffective. According to Popoola (2011), a tree can, in principle, only be felled if a felling permit has been obtained and forestry employees can hammer, mark stumps and logs and issue waybills when felled. It would constitute a rudimentary technique for timber monitoring if this procedure was followed. However, forestry officials are rarely and possibly never, present at the stump and documents may be issued without adherence to procedures. It is therefore effectively impossible to verify the origin of any timber and therefore to determine its legality. There is currently no known intension to introduce timber tracking in Nigeria”. This is responsible for the wide spread of forest crime cutting across business practices, processing and trade.

### **5.9.0 Factors negating good forest governance in Southwestern, Nigeria.**

Factors negating good forest governance; lack of accountability, ineffectiveness, inefficiency, lack of respect for the rule of law, lack of participation and lack of transparency was examined in Southwestern, Nigeria.

#### **5.9.1 Ekiti State**

In Ekiti State Department of Forestry, lack of transparency (*LTRA*) is the only significant factor identified. It was evident the estimated coefficient for the criterion was more than zero. The implication is that the regression parameters in the model were significant. The higher the odd-ratios, the more probable the factors negate Good Forest Governance. It distinctly indicated the factors that mostly negate Good Forest Governance. This assertion was supported by Bland and Altman (2000) and Deeks (1996).

#### **5.9.2 Lagos State**

In Lagos State Department of Forestry, infectiveness (*IEFV*) and lack of participation (*LPAT*) were the significant factors identified were the significant factors identified. It was evident the estimated coefficient for the criterion was more than zero. The implication is that the regression parameters in the model were significant. The higher the odd-ratios, the more probable the

factors negate Good Forest Governance. It distinctly indicated the factors that mostly negate Good Forest Governance. This assertion was supported by Bland and Altman (2000) and Deeks (1996).

### **5.9.3 Ogun State**

In State Department of Forestry Ogun, lack of accountability (*LACC*) was the only significant factor identified. It was evident that the estimated coefficient for the criterion was more than zero. These implying regression parameters in the model were significant. The higher the odd-ratios, the more probable the factors negate Good Forest Governance. It distinctly indicated the factors that mostly negate Good Forest Governance. This assertion was supported by Bland and Altman (2000) and Deeks (1996).

### **5.9.4 Ondo State**

In State Department of Forestry Ondo, lack of transparency (*LTRA*) was the significant factor identified. It was evident that the estimated coefficient for the criterion was not zero. This implied regression parameters in the model were significant. The higher the odd-ratios, the more probable the factors negate Good Forest Governance. It distinctly indicates the factors that mostly negate Good Forest Governance. This assertion was supported by Bland and Altman (2000) and Deeks (1996).

### **5.9.5 Osun State**

In State Department of Forestry Osun, lack of transparency (*LTRA*) was the significant factor identified. It was evident that the estimated coefficient for the criterion was more than zero. This implied the significance of the regressed parameters in the model. The higher the odd-ratios, the more probable the factors negate Good Forest Governance. It distinctly indicated the factors that mostly negate Good Forest Governance. This assertion was supported by Bland and Altman (2000) and Deeks (1996).

### **5.9.6 Oyo State**

In State Department of Forestry Oyo, lack of accountability (*LACC*) was the significant factor identified. It was evident that the estimated coefficient for the criterion was more than zero. This implied the significance of the regressed parameters in the model. The higher the odd-ratios, the more probable the factors negate Good Forest Governance. It distinctly indicated the factors that mostly negate Good Forest Governance. This assertion was supported by Bland and Altman (2000) and Deeks (1996).

### **5.9.7 All Southwestern States Department of Forestry**

The pooled result for the entire Southwestern indicated that lack of participation (*LPAT*) and lack of transparency (*LTRA*) were the significant factors identified. It was evident that the estimated coefficient for the criterion was more than zero. This implied the significance of the regressed parameters in the model. The higher the odd-ratios, the more probable the factors negate Good Forest Governance. This assertion was supported by Bland and Altman (2000) and Deeks (1996)

### **5.10.1 Implementation of Procurement Rules**

Most of the respondents disagreed with the fact that procurement rules have been effectively implemented. This implied the presence of waste, fraud and abuse of power in the system. This was corroborated by Okeahalam (2004), that developing countries have weak procurement regulations that can present some avenues for corrupt practices.

### **5.10.2 Adequate opportunity to report corrupt practices**

A good percentage of the respondents disagreed with the fact there are adequate opportunities to report corrupt practices. Detection and suppression of crimes becomes much more difficult when there are no adequate opportunities provided to report corrupt practices. Since forest crimes are joint effort by forest officials and the public, crimes continues unabatedly. This assertion was corroborated by Oso (2016) that “illegal forest activities in Southwestern, Nigeria were carried out by saw-millers, timber contractors, rural dwellers as well as forestry officials. Saw-millers and timber contractors were directly involved in tree felling and responsible for highest level of

forest offences. However, their activities were in most cases supported by the forest officials and in some cases rural dwellers”.

### **5.10.3 Corruption resistant systems**

Majority of the respondents disagreed with the fact that systems involved in collecting revenue, spending, financial planning, reporting, audit, allocation are resistant to corruption. Systems that are not resistant to corruption are synonymous to institutionalizing corruption. The forest industry has been hampered by huge deforestation anchored by illegal logging, resulting from weak governance and widespread corruption in the country. Dike (1999) corroborated this fact by stating that corruption occurs in many forms, and it has contributed immensely to the poverty and misery of a large segment of the Nigerian population. Corruption has become institutionalized in Nigeria.

### **5.11 Challenges of Forestry Stakeholders**

The challenges of some stakeholders (saw-millers, timber contractors, plank dealers and private forest plantation owners) vary from one stakeholder to another.

The challenges of saw-millers ranging from the highest to the lowest are power failure, high cost of machines / replacement, scarcity of wood, expensive spare parts, high cost of fuel and maintenance. Others are finance, unfavourable government policy, closure of government forest during raining season, scarcity of labour, obsolete machines and lack of access to loan and environmental pollution. This assertion was corroborated by Larinde (2009), who stated that the main constraint militating against the smooth operation of the sawmilling in Nigerian industry apart from reliable energy supply is scarcity of economic timber resources in the forests.

The challenges of timber contactors ranging from the highest to the lowest are scarcity of timber species/choice specie, illegal operations in the forest, difficulty in accessing the forest in raining season/high cost of transportation, finance, incessant tariff increment/multiple way-billing, poachers/Indian hemp planters, loss of logs on water-ways. Seasonality of the timber business, low capital and high transportation cost has also been reported by Akinbani (2015) as major challenges of timber contractors in sawmilling business.

The challenges of plank dealers ranging from the highest to the lowest are lack of funds, scarcity timber/choice timber species, poor infrastructure (as indicated in Plate 5.3), multiple way billing,

Plate 5.3: Sinking vehicle; common occurrence in Plank Markets

difficulty in accessing the forest during raining season, insecurity, poor sales, exploitation by timber contractor. Others are environmental pollution, closure of government forest during raining season, bad road, high cost of timber, debt of customers, seizure of hammer, lack of access to loan, arbitrary change in tariff. Aiyeloja *et al.* (2016) also affirmed sustainable supply of timber as a major constraint to timber dealers in their trade.

The challenges of private forest plantation owners ranging from the highest to the lowest are lack of funds, seedling/seed procurement, high cost of land, land tenure issues, fire outbreak, no assistance from the government, low pricing, illegal logging, lack of technical skills, and urbanization. These challenges hamper the smooth running of operations in the forest sector, frustrate stakeholders out of the business and discourage new entrants into business, thereby, reducing this venture largely to the government agencies. Akinbowale *et al.* (2019) supporting this assertion opined that only government agencies have been majorly involved in forest development in Nigeria.

### **5.12.0 Factors influencing stakeholders' willingness to establish forest plantation in Southwestern, Nigeria**

In this study, willingness to establish forest plantation was investigated among some forestry stakeholders (saw millers, timber contractors and plank dealers) to ascertain if incentives such as training, seedlings, provision of fast growing species and favorable government policy were provided.

#### **5.12.1 Saw millers in Southwestern Nigeria**

Amongst the saw millers in Southwestern, Nigeria, Training (*TRNG*), and Provision of Fast Growing Species (*PFGS*) were the significant factors identified. There was ample evidence to determine that the approximate coefficient for the criterion was not zero. The assumption is that the parameters of regression were important in the model. The greater the odd-ratios, the greater the probability, that the variables affected the willingness to set up forest plantings. This assertion was supported by Bland and Altman (2000) and Deeks (1996).

#### **5.12.2 Timber contractors in Southwestern Nigeria**

Amongst the timber contractors in Southwestern, Nigeria, no significant factor was identified. The estimated coefficient for the criterion was zero. The implication is that the regression parameters in the model were not significant. The higher the odd-ratios, the more likelihood the factors influenced Willingness to establish forest plantation. This assertion was supported by Bland and Altman (2000) and Deeks (1996).

#### **5.12.3 Plank dealers in Southwestern Nigeria**

Amongst the plank dealer in Southwestern Nigeria, Training (*TRNG*), Provision of Seedlings (*PSDLNS*) and Provision of Fast Growing Species (*PFGS*) were the significant factors identified. There was enough proof that the estimated coefficient for the criterion was not zero. This implied that the regression parameters in the model were significant. The higher the odd-ratios, the more likelihood the factors influenced Willingness to establish forest plantation. It distinctly indicated the factors that mostly influence willingness to establish forest plantation. This assertion was supported by Bland and Altman (2000) and Deeks (1996).

#### **5.12.4 Pooled Forestry Stakeholders in Southwestern Nigeria**

Amongst all the forestry stakeholders in Southwestern Nigeria, Training (*TRNG*) and Provision of Seedling (*PSDLNS*) were the significant factors identified. There was ample evidence to determine that the approximate coefficient for the criterion was not zero. The assumption is that the parameters of regression were important in the model. The greater the odd-ratios, the greater the probability, that the variables affected the willingness to set up forest plantings. This assertion was supported by Bland and Altman (2000) and Deeks (1996).

## CHAPTER SIX

### 6.1.1 Summary of major findings

### 6.1.2 Forest cover in selected forest reserves in Southwestern, Nigeria in 2017

- Forest cover in the forest reserves; Ogun River, Ogbese, Ikere, Aworo, Olokemeji, Oluwa, Akure, Shasha, Ago-Owu, Onigambari and Osho in 2017 were: 5.24km<sup>2</sup>, 39.52km<sup>2</sup>, 9.6km<sup>2</sup>, 164.61km<sup>2</sup>, 73.56km<sup>2</sup>, 686.73km<sup>2</sup>, 23.26km<sup>2</sup>, 293.16km<sup>2</sup>, 31.87km<sup>2</sup>, 88.34km<sup>2</sup>, 2.08km<sup>2</sup> and 29.08 km<sup>2</sup>, respectively amounting to 1444.97 km<sup>2</sup> in all the forest reserves.

### 6.1.3 Forest cover changes in forest reserves in Southwestern, Nigeria between 1987 and 2017

- Ogun River, Ogbese, Ikere, Aworo, Olokemeji, Oluwa, Akure, Shasha, Ago-Owu, Onigambari and Osho forest reserves, forest cover ranged as follows from 1987 to 2017; 97.69% - 33.91%, 78.57% - 55.35%, 62.99% - 69.54%, 95.01% - 69.54%, 86.53% - 81.60%, 90.89% - 79.87%, 99.03% - 31.63%, 98.89% - 91.70%, 93.74% - 72.57%, 94.5%, -81.87% and 92.56 - 44.67% while the forest cover changes and percentage changes in Ogun River, Ogbese, Ikere, Aworo, Olokemeji, Oluwa, Akure, Shasha, Ago-Owu, Onigambari , Osho from 1987 to 2017, were -9.85km<sup>2</sup> and -65.28%, -16.58 km<sup>2</sup> and -29.55%, 1.38 km<sup>2</sup> and 16.79%, -60.31 km<sup>2</sup> and -26.81%, -12.97 km<sup>2</sup> and -14.99%, -94.81 km<sup>2</sup> and -12.13%, -4.56 km<sup>2</sup> and -16.39%, -22.96 km<sup>2</sup> and -7.26%, -261.29 km<sup>2</sup> and -89.13%, -13.64 km<sup>2</sup> and -13.38%, -31.18 km<sup>2</sup> and -51.74% respectively.

#### **6.1.4 Rate of deforestation**

- Rate of deforestation in the selected forest reserves in 1987 and 2017 in Ogun River, Ogbese, Ikere, Aworo, Olokemeji, Oluwa, Akure, Shasha, Ago-Owu, Onigambari and Osho were: 2.13%; 0.77%; -0.22%; 0.85%; 0.48%; 0.37%; 2.25%; 0.24%; 0.71%; 0.42% and 1.60%. The trend in this reserve showed massive deforestation within the thirty year period with exception to Ikere forest reserve in Ekiti State which recorded -2.38% rate of deforestation between 1987 and 1997 this explains the reason for higher rate of reforestation than deforestation during the period. The forest reserves have been encroached upon and unabated deforestation which is in variance with good forest governance is evident.

#### **6.1.5 Forest policy existence**

- All the State Department of Forestry (Ekiti, Lagos, Ogun, Ondo, Osun and Oyo) in Southwestern, Nigeria acknowledged the fact that the following forest policies on sustainable forest management existed; afforestation and reforestation project in order to increase the forest resources, biological diversity in strengthening and expanding non forest components, forest health and vitality through silvicultural practices, productive functions through funding and silvicultural practices, protective or environmental social and economic functions of forest to sustainable livelihoods of forest dependent people for and institutional framework support provided by the states.

#### **6.1.6 Level of implementation of forest policy**

- Rating on the implementation level of forest policies in the last 10 years in Southwestern, Nigeria on afforestation and reforestation project in order to increase the forest resources (46.17%) , biological diversity in strengthening and expanding non forest components (37.33%), forest health and vitality through silvicultural practices (41.50%), productive functions through funding and silvicultural practices (46.0%), protective or environmental functions (40.80%), social and economic functions of forest to sustainable livelihoods of forest dependent people (55.0%) and institutional framework support provided by the states (55.0%) and sustainable forest management (45.0%).
- Rating on the implementation level of forest policies on sustainable forest management in the last 5 years in Southwestern, Nigeria on afforestation and reforestation project in

order to increase the forest resources (37.83%) , biological diversity in strengthening and expanding non forest components (35.50%), forest health and vitality through silvicultural practices (38.67%), productive functions through funding and silvicultural practices (33.33%), protective or environmental functions (47.33%) social and economic functions of forest to sustainable livelihoods of forest dependent people (47.83%) and institutional framework support provided by the states (37.00%) and sustainable forest management (39.64%).

- Rating on the implementation level of forest policies on sustainable forest management in the last 2 years in Southwestern, Nigeria on afforestation and reforestation project in order to increase the forest resources (31.00%) , biological diversity in strengthening and expanding non forest components (35.50%), forest health and vitality through silvicultural practices (35.83%), productive functions through funding and silvicultural practices (29.17%), protective or environmental functions (43.33%), socio-economic functions of forest to sustainable livelihoods of forest dependent people (58.33%) and institutional framework support provided by the states (34.17) and sustainable forest management (38.19%).

#### **6.1.7 Planning in forest resources management**

- Planning existed in all the State Department of Forestry in Southwestern, Nigeria.
- Despite the existence of plans, they were not current and regularly updated.
- Checks and balances that do not.
- Stakeholder were not engaged, given space and supported in participating in forest-related planning.
- Support was not given to stakeholders in forest-related planning.
- State Department of forestry took into consideration activities on private forestlands only on tariff related issues.
- Forest related issues that cuts across other sectors are not addressed.

- Recording and reporting management activities were carried out.

#### **6.1.8 Decision-making processes**

- Supply and demand on forest issues do not influence State Department of Forestry's decision making decisions.
- Opportunities exist for affected people to influence forest policy.
- No consultations with stakeholder
- The State Department of Forestry does not involve forest-dependent communities in forestry decision-making.
- The government does not have the capacity in engaging stakeholders in decision-making process and implementation.

#### **6.1.9 Stakeholders' participation in forest resources management in Southwestern, Nigeria**

- No opportunity for Stakeholders in the creation of forest policy.
- Formal mechanisms to influence forest policy exist except in Ondo state.
- Participation in forestry issues is gender sensitive except in Ondo state.
- There is no access to information on forestry issues by stakeholders.
- There are no public notices of forestry matters.
- No adequate access for Loan for Investment in Forest-based businesses.

#### **6.1.10 Forest Law Enforcement**

- Sanctions are not commensurate to forest offenses.
- Equipment for operations by forest officials is inadequate.
- The assigned land areas to forest officials are not effectively covered.
- Staff are not sufficient for effective coverage of land area.
- There are no effective measures for forest crime prevention.
- There are no effective measures for forest crime detection.
- There are no effective measures for forest crime suppression.
- Serious forest crimes are not investigated.
- Extent of effort against forest crime does not effectively cover transport, processing and trade.

#### **6.1.11 Existence of Good Forest Governance**

- The factors that influenced Poor Forest Governance in Southwestern, Nigeria were lack of transparency and lack of participation.

#### **6.1.12 Effort in Mitigating Corruption**

- Procurement rules are not being effectively implemented.
- There are no adequate opportunities to report corrupt practices.
- Systems in the State department of forestry are not resistant to corruption.

#### **6.1.13 Challenges of stakeholders**

- The challenges of saw-millers ranging from the highest to the lowest are power failure, high cost of machines/replacement, scarcity of timber, expensive spare parts, high cost of

fuel and maintenance, finance, unfavourable government policy, closure of government forest during raining season, scarcity of labour, obsolete machines and lack of access to loan and environmental pollution.

- The challenges of timber contactors ranging from the highest to the lowest are scarcity of timber/choice specie, illegal operations in the forest, difficulty in accessing the forest in raining season/high cost of transportation, finance, incessant tariff increment/multiple way-billing, poachers/Indian hemp planters, loss of logs on water-ways on.
- The challenges of plank dealers ranging from the highest to the lowest are lack of funds, scarcity timber/choice timber species, poor infrastructure, multiple way billing, difficulty in accessing the forest during raining season, insecurity, poor sales, exploitation by timber contractor, environmental pollution, closure of government forest during raining season, bad road, high cost of timber, debt of customers, seizure of hammer, lack of access to loan, arbitrary change in tariff.
- The challenges of private forest plantation owners ranging from the highest to the lowest are lack of funds, seedling/seed procurement, high cost of land, land tenure issues, fire outbreak, lack of assistance from the government, low pricing, illegal logging, lack of technical skills, and urbanization.

## **6.2.0 CONCLUSION AND RECOMMENDATIONS**

### **6.2.1 Conclusion**

- The extent of forest cover in Ogbese, Ikere, Ogun River, Aworo, Olokemeji, Oluwa, Akure, Shasha, Ago-Owu, Onigambari , Osho forest reserves in the year 2017 was about 1444.97 km<sup>2</sup> reflecting a deficit of 526.77 km<sup>2</sup> during a thirty year period (1987 – 2017)
- . The forest cover change and percentage change in all the forest reserve displayed a total of 526.77 km<sup>2</sup> deficit and 26.72% respectively.
- Adequate technical and professional staffs are not on ground to execute the mandate of state departments of forestry with respect to forest reserves in Southwestern Nigeria.
- All the States under study revealed that forest policy elements on sustainable forest management existed. Existence of forest policy on sustainable forest management implied political will to manage forests well. Ensuring sustainable forest management of course requires much more than political will. Political will to manage forests well, affords a good start.
- The study probed into the level of implementation of the existing policy on sustainable forest management considering the elements of sustainable forest management which. In all the ratings, in the last 10, 5 and 2 years. All fell below 50 percent level of implementation on the average. This left a lot to be desired. The implication is that sustainable forest management will be very difficult to accomplish in Southwestern, Nigeria if this trend observed continues.
- Planning, decision-making and stakeholders participation is at the lowest ebb in the study area. Planning is the brain work before eventual implementation. If anything goes amiss with planning failure is inevitable. In the same vein, all inclusive decision-making which reflects the yawning and aspirations of the people whose livelihood heavily rely on the forest and stakeholders' active participation are of utmost importance.
- Timber scarcity cuts across, as a major challenge among stakeholders who are tree takers (saw-millers, timber contractors and plank dealers) while lack of finance is a major challenge among private forest plantation owners. These challenges hamper the smooth

running of activities in forest sector, frustrate stakeholders out of the business and discourage new entrants.

- In terms of ownership of forest plantation among the stakeholders; less than 5 percent among saw-millers, none among timber contractors and less than 2 percent among plank dealers own forest plantation among those interviewed. Majority were willing to own forest plantation if necessary support was given, such as; introduction of fast growing tree species, provision of seedlings and training on forest plantation establishment.
- Lip service is being paid to forest law enforcement in Southwestern, Nigeria. Sanctions are not commensurate to forest offences. When pros and cons of breaking forest laws are weighed, it seems to pay-off breaking the law. Imprisonment seems to be a mere threat. Forest offenders do always have their way and go scot free, through compounding if by mistake they got caught. The institutional framework that should support the course of enforcement is lacking. Effort to handle big offenders proves to always be a lost battle in the light of the sophistication of the fire-arms of some offenders.
- Effective forest governance is not being practiced in Southwestern, Nigeria. The factors that influenced Poor Forest Governance were transparency and participation, with odd-ratios of 94.46 and 79.36 respectively.
- In State Department of Forestry Southwestern, Nigeria, the mode of operation is corruption infected. The system in itself is self destructive. Procurement rules are not being effectively implemented. There are no credible laid down ways of reporting corrupt practices.
- Saw millers, timber contractors and plank dealers were willing to establish their own forest plantation. The factors that influenced stakeholders' willingness to establish forest plantation were provision of seedlings and training with odd-ratios of 12.87 and 2.34.

## **6.2.2 Recommendations**

- The National Forest Act which is a more robust policy document should be approved by the National Assembly since the forest law of the State is long overdue for review and revision.
- Adequate funds should be released as at when due to ensure effective forest policy implementation.
- Management plan in all the State Department of Forestry should be current and regularly updated.
- Forestry stakeholders should be engaged, given space and supported in participating in forest-related planning and decision-making processes.
- The government should come up with a system to fix forest problems that cut through other sectors.
- Supply and demand should inform decision making process.
- Stakeholders should be carried along and consulted in decision making processes.
- The government should increase her capacity in engaging stakeholders in decision-making processes and implementation.
- Stakeholders in forestry should be involved in the creation of forest policy.
- Provision of incentives for plantation establishment
- Forest law should be reviewed for lower tariffs for private plantation owners.
- Concessionary interest rates should be given for forest-based business loans.
- Forestry stakeholders should be encouraged to establish jointly owned forest plantation considering their level of organisation and their willingness to establish forest plantation.
- Sanctions for forest offences should be commensurate to forest offenses.
- Ensure adequate provision of equipment for operations by forest officials.

- The State Department of Forestry should ensure suppression, prevention and detection of forest crimes.
- The investigative apparatus of the Forestry Department should be well developed and investigation of serious forest crimes carried out.
- Extent of effort against forest crime should adequately cover transport, processing and trade.
- Public complaint office should be set-up whose office should be separated from the forest officials who are being reported and the complainant should be adequately protected from being witch-hunted.
- Inventory using GIS to reveal current extent of forest cover, forest cover changes and rate of deforestation of the forest reserves should be regularly carried out in all the State Department of Forestry.
- There is a dire need for reform in the State Departments of Forestry, Southwestern Nigeria to ensure effective forest governance

### **6.2.3 Contribution to Knowledge**

- The extent of forest cover in Ogbese, Ikere, Ogun River, Aworo, Olokemeji, Oluwa, Akure, Shasha, Ago-Owu, Gambari, Osho forest reserves in the year 2017 was about 1444.97 km<sup>2</sup> reflecting a deficit of 526.77 km<sup>2</sup> and percentage change of -309.87% at 9.6% rate of deforestation during a thirty-year period (1987 – 2017) thus indicating Poor Forest Governance.
- Policies on sustainable forest management exist. Planning exist, though plans are not updated regularly. Decision-making processes are weak due to poor stakeholders' participation thus implying state-centric forest governance.
- Forest law enforcement is faced with the problems of inadequacy of sanctions, lack of equipment, deficiency of staff, limited extent of coverage against forest crimes

ineffective crime prevention and detection, hence encouraging lack of respect for the rule of forest law.

- Lack of transparency, which encouraged different shades of corruption and ensured systems not resistant to corruption, was prevalent in the state department of forestry southwestern, Nigeria.
- Good forest governance is not being practiced in Southwestern, Nigeria. The factors that influenced Poor Forest Governance were lack of transparency and lack of participation with odd-ratios of 94.46 and 79.36 respectively.
- About 68% of forestry stakeholders were willing to establish forest plantation. The factors that influenced their willingness were provision of seedlings and organizing trainings for them in forest plantation establishment with odd-ratios of 12.87 and 2.34 respectively.

## **APPENDICES**

### **Appendix 1: Faculty of Agriculture and Forestry**

#### **Department of Forest Resources Management**

#### **University of Ibadan, Nigeria.**

#### **Dear Respondent,**

Thank you for making out time in filling this questionnaire as one of the stakeholders in forestry. This questionnaire is designed to gather data on “**Assessment of Forest Governance in Southwestern Nigeria.**” It is strictly for academic purpose, so kindly feel free to answer the questions below. Any information given therefore will be kept confidential. **Thank you.**

**Owese Theophilus**

## Checklist on Existing forest policies on sustainable forest management and their implementation

Which of the following forest policies on sustainable forest management and its elements exist, are being implemented and how would you rate the level of implementation in the past 10, 5 and 2 years on a scale of 0 – 100 % for these periods. On columns 1 and 2 (Existence and Implementation) tick Yes as (√) and No as (X), while for columns 3, 4 and 5 (10, 5 and 2 years respectively) rate the level of implementation on a scale of 0 – 100 % as the case may be.

| S/N | Forest Policy                                    | Existence | Implementation | Level of Implementation in 10 years (%) | Level of Implementation in 5 years (%) | Level of Implementation in 2 years (%) |
|-----|--|-----------|----------------|---|--|--|
| 1.  | Afforestation and reforestation                  |           |                |   |  |  |
| 2.  | Biological diversity                             |           |                |   |  |  |
| 3.  | Silvicultural practices                          |           |                |   |  |  |
| 4.  | Funding  |           |                |   |  |  |
| 5.  | Forest Protection and Environmental amelioration |           |                |   |  |  |
| 6.  | Socio-economic functions                         |           |                |   |  |  |

## Appendix II

### Questionnaire for Professional and Technical Staff

#### A. Background Information

1) Gender: a) Male ( ) (b) Female ( )

2) Age \_\_\_\_\_

3) Qualification: \_\_\_\_\_

4) Years in service: \_\_\_\_\_

5) Cadre \_\_\_\_\_

6) State \_\_\_\_\_

| S/N | <b>B. Planning Process</b>   | Yes | No |
|-----|--|-----|----|
| 7.  | Plans are made   |     |    |
| 8.  | These plans are current and regularly updated  |     |    |
| 9.  | Management plans exist   |     |    |
| 10. | Checks and balances are in effect to prevent sudden and unreasonable changes in forest regulations, policies and plans.  |     |    |
| 11. | In making forest-related decisions, the forestry department uses supply and demand data  |     |    |
| 12. | Forestry department gives opportunities, encourages the public, indigenous inhabitants, forest dependent settlements with planning associated with forests.                |     |    |
| 13. | In policy making and planning for the forestry sector, forestry department takes account of private forestry operations.   |     |    |
| 14. | Mechanisms exist within the government to tackle cross-sectorial strategy, planning, or practice matters related to forests.   |     |    |
| 15. | State Department of Forestry record and report its management activities   |     |    |
|     | <b>C. Decision-making Process</b>  | Yes | No |
| 16. | In making decisions linked to forests, forestry department make use of supply and demand data  |     |    |
| 17. | Stakeholders have the opportunity to contribute to forest policy creation, public forest management plans and subsidiary laws.   |     |    |
| 18. | There are official channels for individuals who are influenced by forest policy to influence it.   |     |    |
| 19. | Consultations with stakeholders are conducted for public forests and the feedback is used in decision-making.  |     |    |
| 20. | Forestry department creates opportunities and encourages the public, indigenous habitants and involvement of forest-dependent societies in forest-related decision making. |     |    |
| 21. | Forestry department have the ability to involve stakeholders in forest-related decision-making and execution processes.  |     |    |

|     |   |  |  |
|-----|---|--|--|
| 22. | Stakeholders have realistic and successful means of requesting review or reconsideration of forestry department decisions |  |  |
|-----|---|--|--|

### Appendix III

#### Questionnaire for Uniformed staff

##### A. Background Information

1) Gender:            a) Male ( )        (b) Female ( )

2) Age \_\_\_\_\_

3) Qualification: \_\_\_\_\_

4) Years in service: \_\_\_\_\_

5) State \_\_\_\_\_

| S/N | B. Capacity for Law enforcement   | YES        | NO        |
|-----|---|------------|-----------|
| 6.  | Do forest laws exist and are adequate (i.e. penalties are adequate and graduated to suit the offense)   |            |           |
| 7.  | Do you have the necessary equipment for this job?   |            |           |
| 8.  | Can you effectively cover the land assigned to you?   |            |           |
| 9.  | Do you think there are enough staff to adequate cover the forest reserve?   |            |           |
| 10. | In enforcing forest law techniques applied include successful forest crime reduction initiatives  |            |           |
| 11. | The forest law enforcement policy requires proactive steps to identify forest crimes.   |            |           |
| 12. | Forest Land law enforcement policy requires successful forest crime suppression initiatives   |            |           |
| 13. | On a regular basis, allegations of serious forest crimes are investigated   |            |           |
| 14. | Forestry department's efforts in tackling forest crime span the entire supply chain of trees, including shipping, production and trade.                     |            |           |
|     | <b>C. Planning Process</b>  | <b>Yes</b> | <b>No</b> |
| 15. | Plans are made  |            |           |
| 16. | These plans are current and regularly updated   |            |           |
| 17. | Management plans exist  |            |           |
| 18. | Checks and balances are in effect to prevent sudden and unreasonable changes in forest regulations, policies and plans.                                     |            |           |
| 19. | In making forest-related decisions, the forestry department uses supply and demand data   |            |           |
| 20. | Forestry department gives opportunities, encourages the public, indigenous inhabitants, forest dependent settlements with planning associated with forests. |            |           |
| 21. | In policy making and planning for the forestry sector, forestry department takes account of private forestry operations.                                    |            |           |
| 22. | Mechanisms exist within the government to tackle cross-sectorial strategy,  |            |           |

|     |  |            |           |
|-----|--|------------|-----------|
|     | planning, or practice matters related to forests.  |            |           |
| 23. | State Department of Forestry record and report its management activities   |            |           |
|     | <b>D. Decision-making Process</b>  | <b>Yes</b> | <b>No</b> |
| 24. | In making decisions linked to forests, forestry department make use of supply and demand data  |            |           |
| 25. | Stakeholders have the opportunity to contribute to forest policy creation, public forest management plans and subsidiary laws.   |            |           |
| 26. | There are official channels for individuals who are influenced by forest policy to influence it.   |            |           |

| 29. | Forestry department have the ability to involve stakeholders in forest-related decision-making and execution processes.  |            |           |
| 30. | Stakeholders have realistic and successful means of requesting review or reconsideration of forestry department decisions  |            |           |

## Appendix IV: Questionnaire for Saw millers, Timber Contractors

*Please tick the category you belong to among the following: Saw miller ( ) Timber contractor ( )*

### A. Background Information

1. Gender: a) Male ( ) b) Female ( ) 2. Age \_\_\_\_ 3. Qualification \_\_\_\_ 4. Years in Business:

\_\_\_\_\_

5. What challenges are you faced with, in your business? \_\_\_\_\_

6. Do you own a forest plantation? a) Yes ( ) (b) No ( )

7. If No, why is it you do not own a plantation?  
\_\_\_\_\_

8. Are you willing to own a forest plantation? (a) Yes ( ) (b) No ( )

9. If training is given, are you willing to own a forest plantation? (a) Yes ( ) (b) No ( )

10. If seedlings are given, are you willing to own a forest plantation? (a) Yes ( ) (b) No ( )

11. If fast growing species are given, are you willing to own a forest plantation? (a) Yes ( ) (b) No ( )

12. Given a favourable government policy are you willing to own a forest plantation? (a) Yes ( ) (b) No ( )

| S/N | B. Stakeholder's participation and perception  | Yes        | No        |
|-----|--|------------|-----------|
| 13. | Stakeholders are involved in the creation of forest policies   |            |           |
| 14. | Forest policy stakeholders have formal processes to influence forest policy.                                   |            |           |
| 15. | Stakeholder meetings are held and feedback is used in decision making.   |            |           |
| 16. | Participation in decision-making processes are gender sensitive  |            |           |
| 17. | There are opportunities for stakeholders to review the Department's decisions.                                 |            |           |
| 18. | Access information about forestry  |            |           |
| 19. | Public notice of planned forest policies, services, laws and projects is provided by the relevant authorities. |            |           |
| 20. | stakeholders willing to invest in the forestry sector have ample access to credit.                             |            |           |
| 21  | Stakeholders have knowledge on forestry issues   |            |           |
|     |  |            |           |
|     |  |            |           |
|     | <b>C. Factors influencing Good Forest Governance</b>   | <b>YES</b> | <b>NO</b> |

|     |  |    |   |   |   |    |
|-----|--|----|---|---|---|----|
| 21. | The State Department of Forestry is practicing good forest governance  |    |   |   |   |    |
| 22. | The Department carries out its duty in its acts and decisions, i.e. they are accountable to all members of society.  |    |   |   |   |    |
| 23. | The Department produces results that meet their desired goals i.e. they are effective.   |    |   |   |   |    |
| 24. | Without undue waste or delay, the Department maximises the use of human, financial and other resources, i.e. They are effective,   |    |   |   |   |    |
| 25. | The Department gives all members of society equal opportunities to enhance or preserve their well-being, including the impartial application of laws, i.e. respect for the rule of law.    |    |   |   |   |    |
| 26. | The Department involves individuals and stakeholders in decision-making, either directly or through legal intermediaries who serve their interests, i.e. participation in decision-making. |    |   |   |   |    |
